

DevSecOps in the Real World: Best Practices for CI/CD and Microservices

Hendri Karisma

Hello!

my name is Hendri Karisma

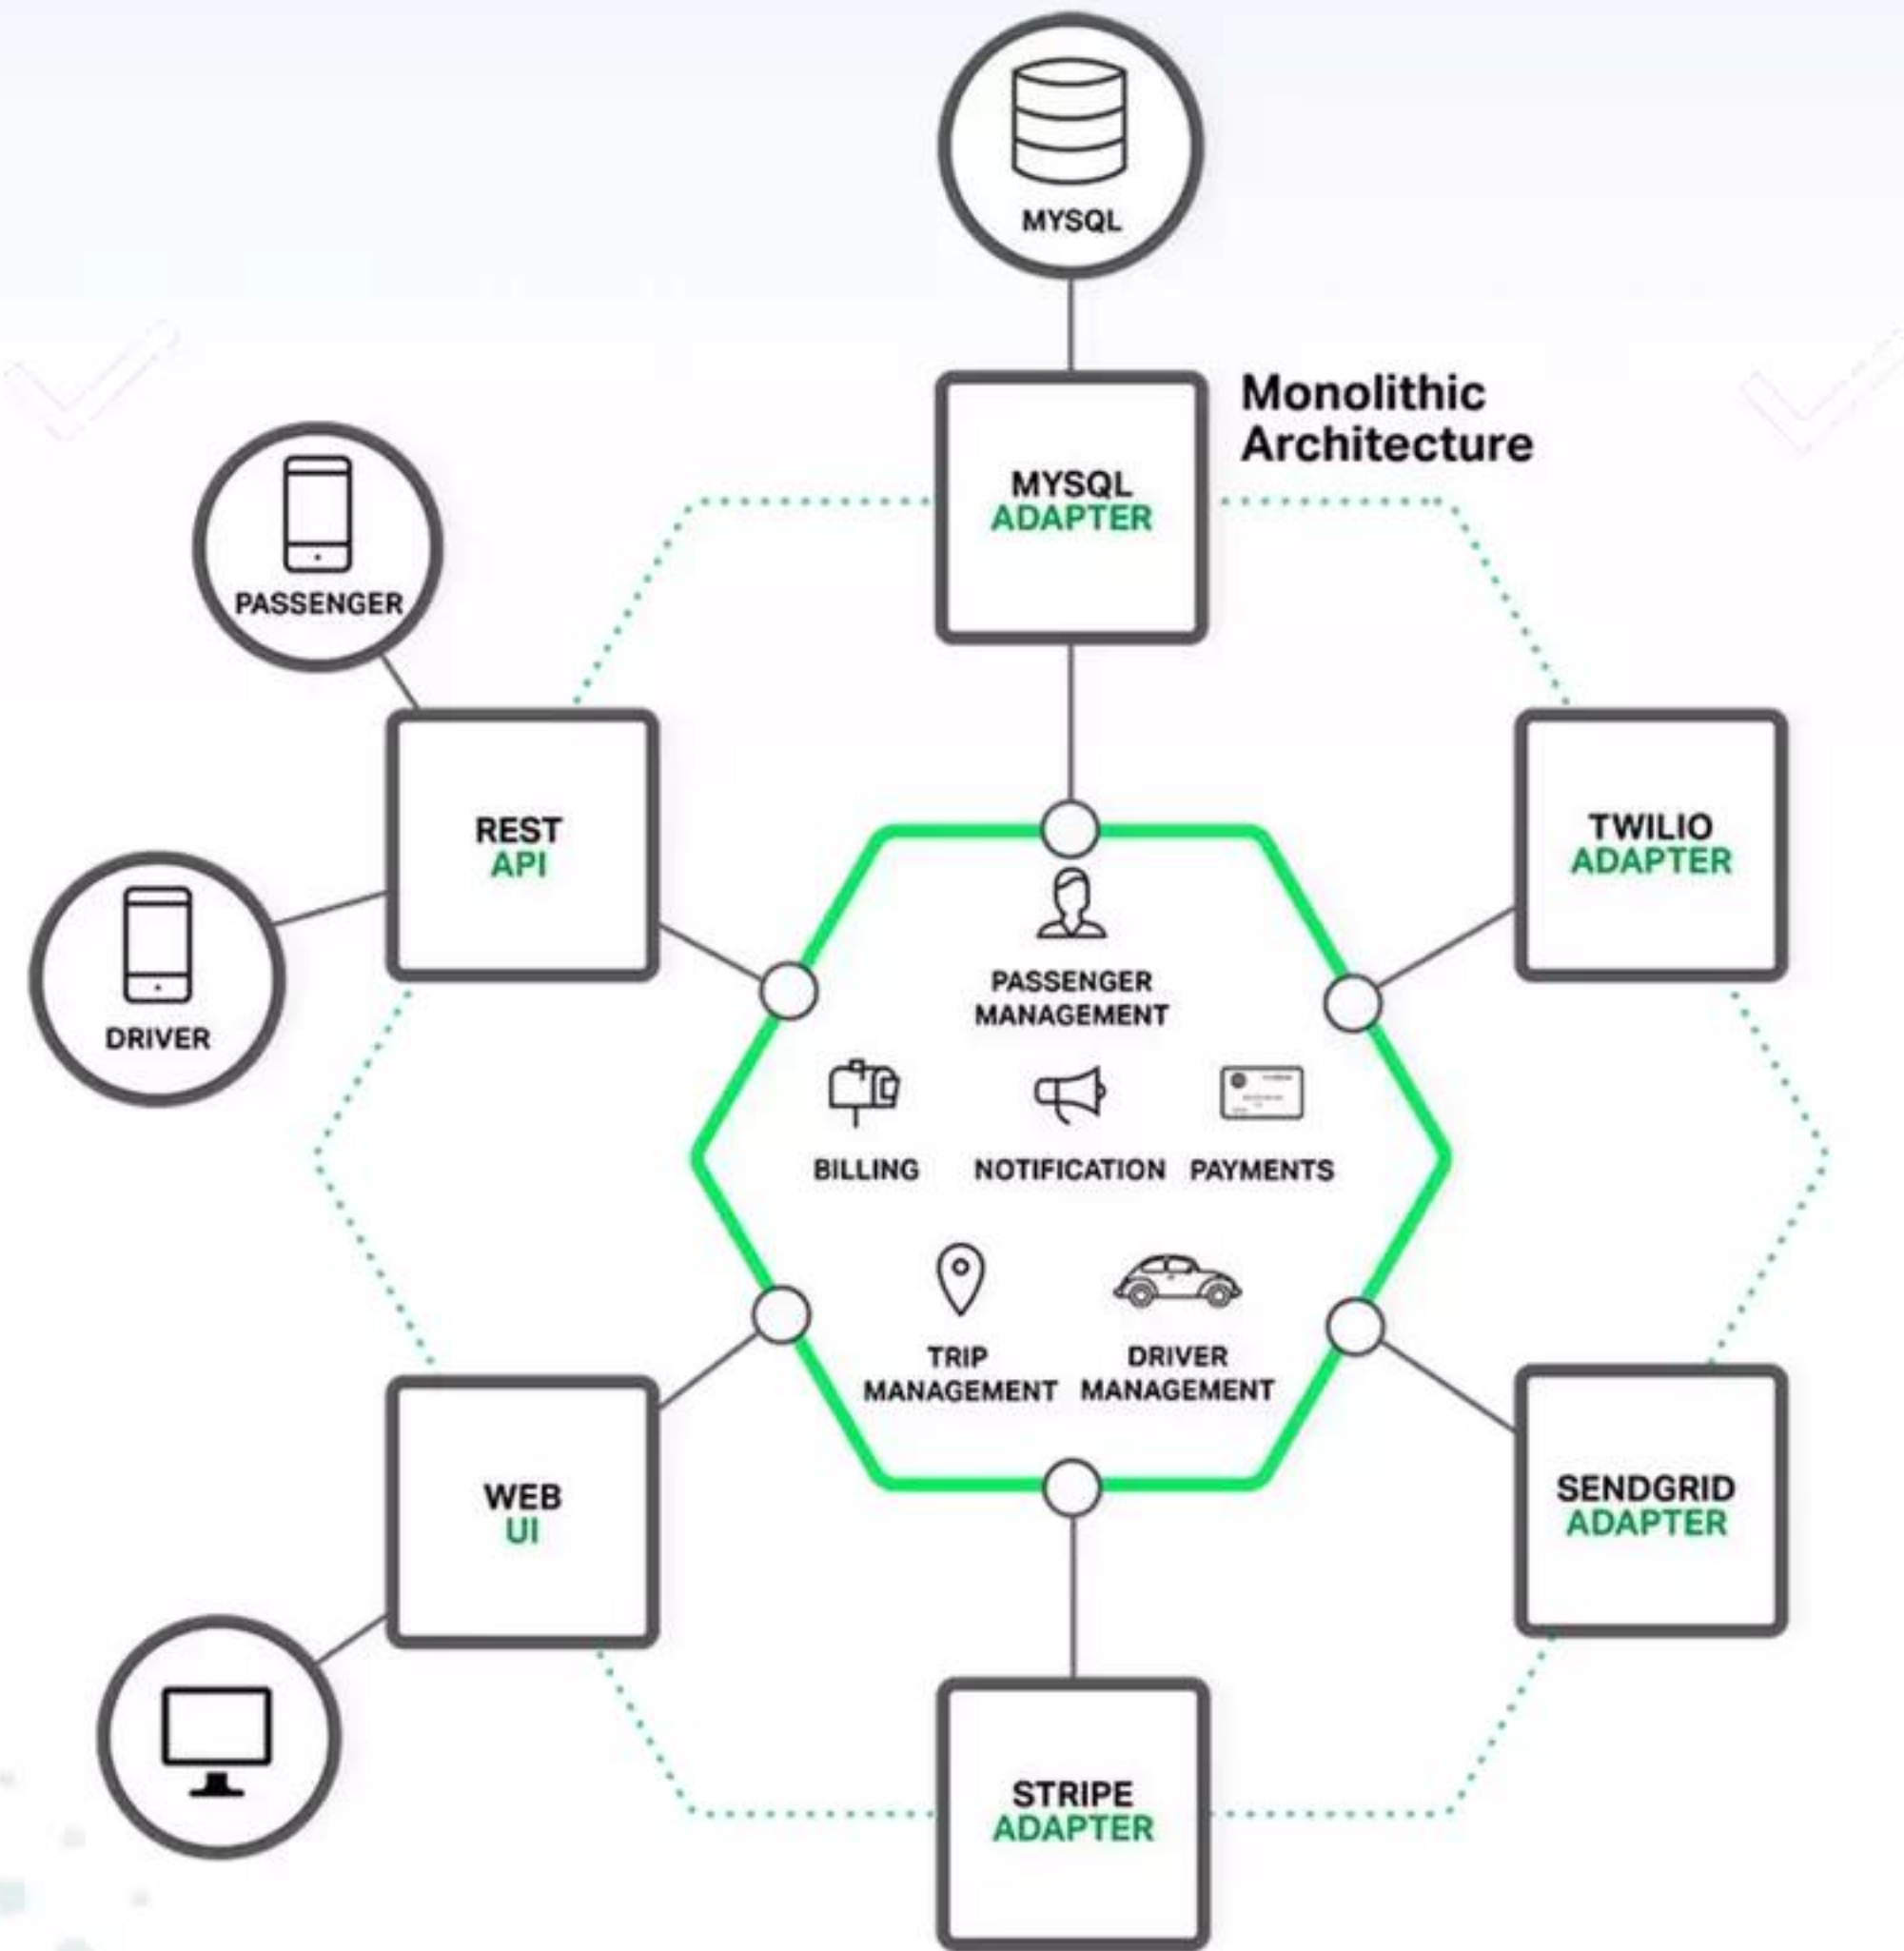

- Technical Lead
- Working on platform system
- Before working for AI and DevEx

Micro-services

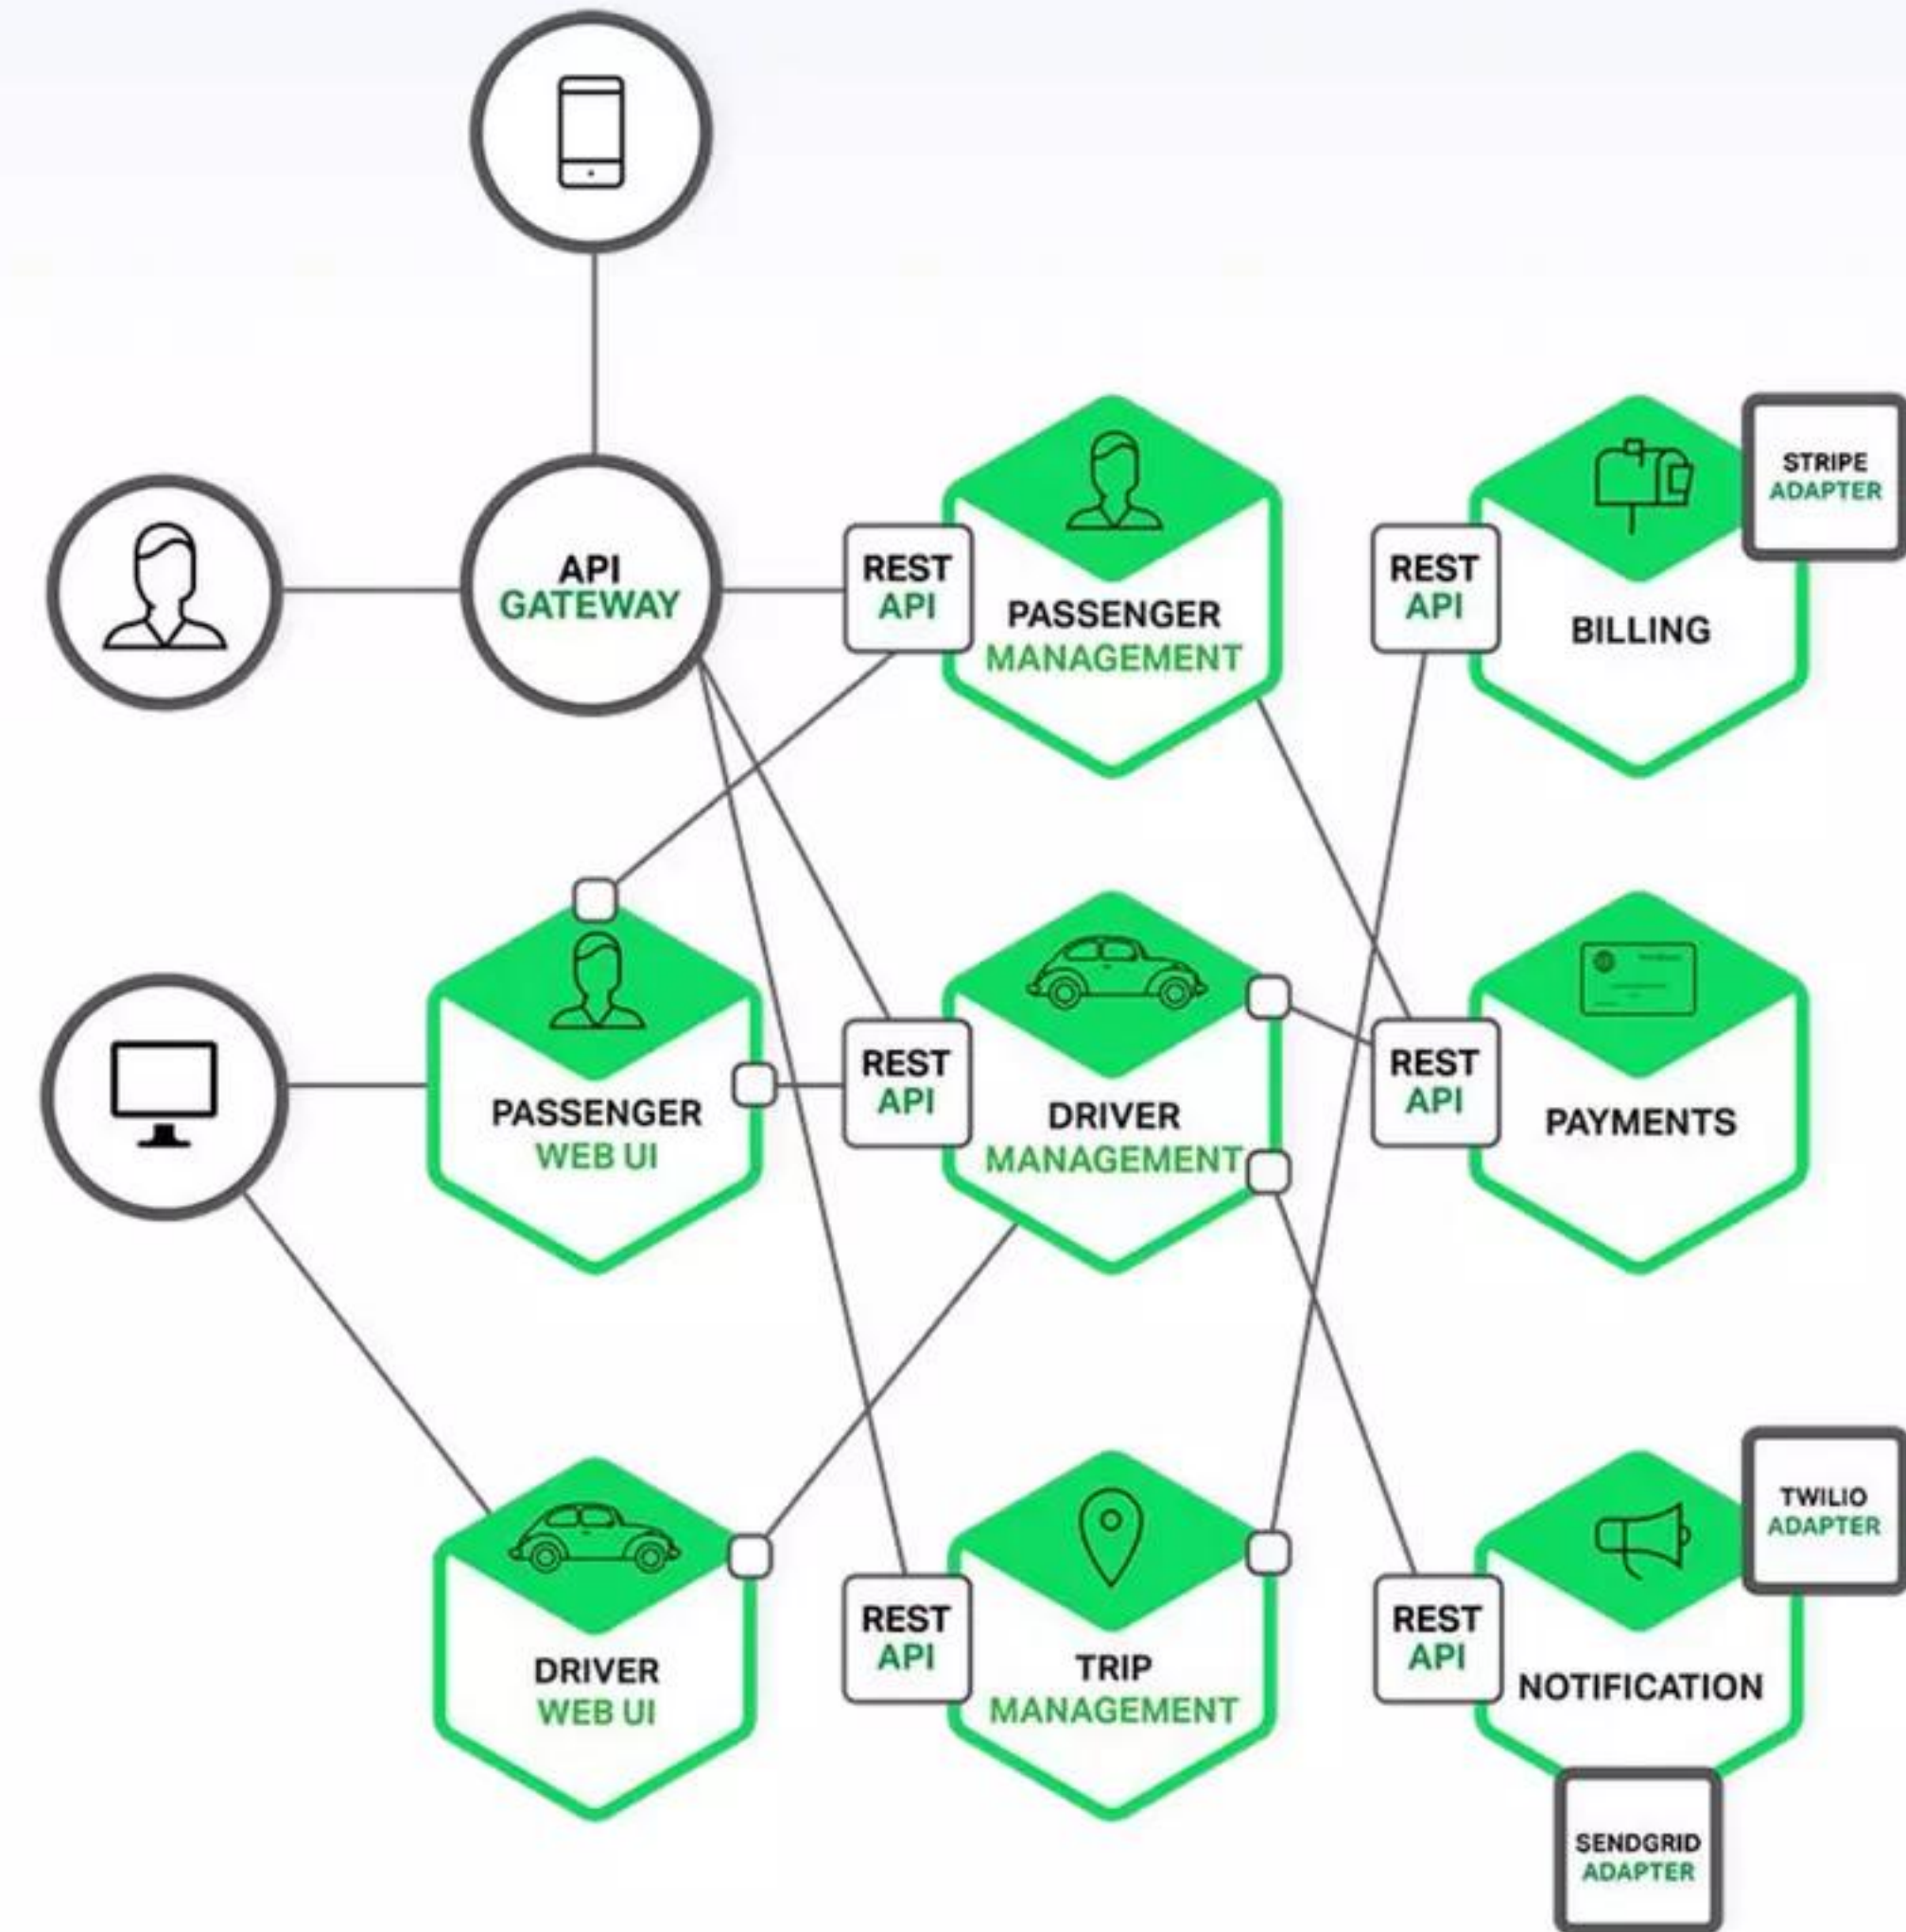

an architectural style that structures an application as a collection of services

- Highly maintainable and testable
- Loosely coupled
- Independently deployable
- Organized around business capabilities
- Owned by a small team

Monolith vs Microservices?

Monolith Architecture

Microservices Architecture

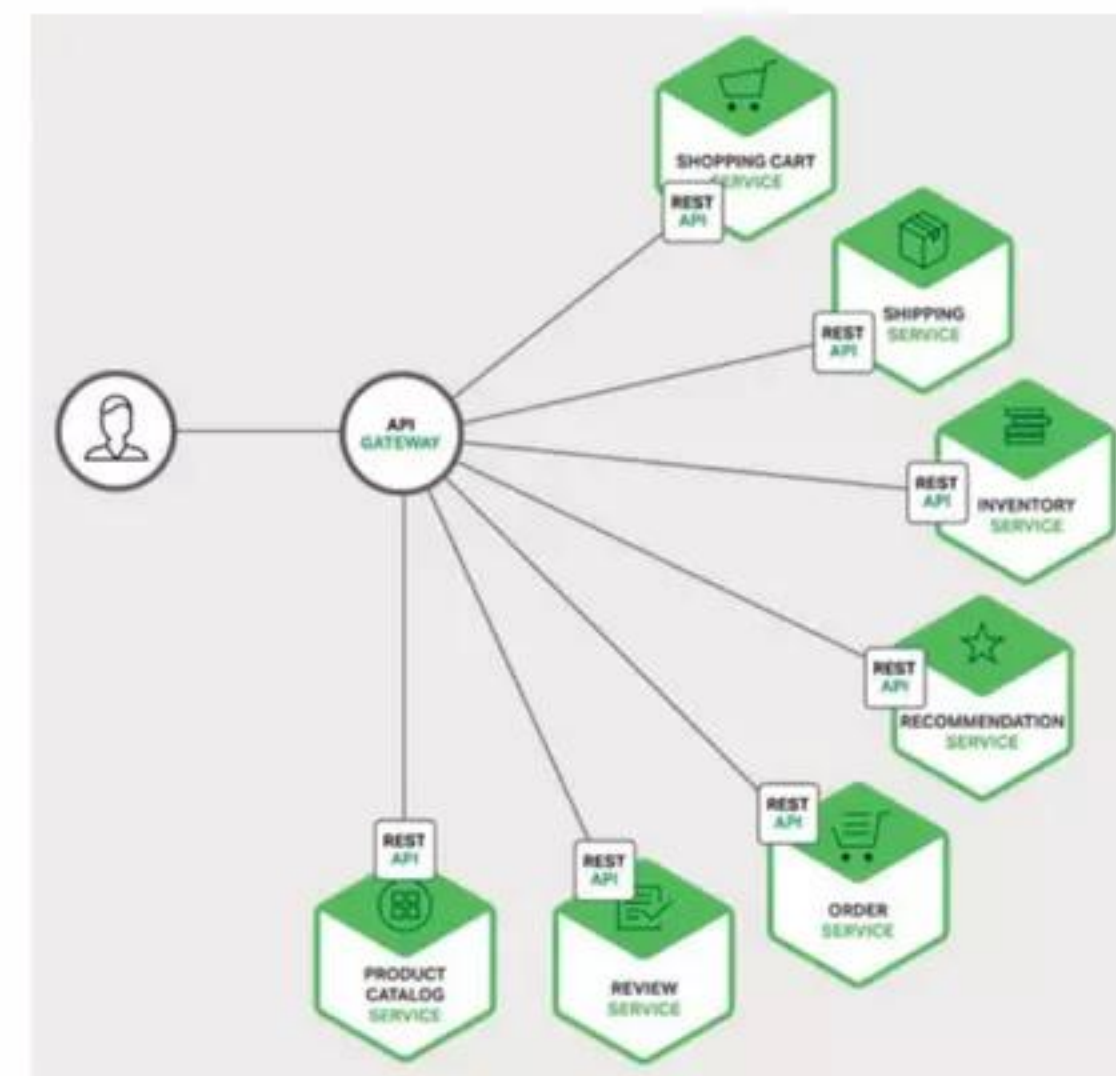

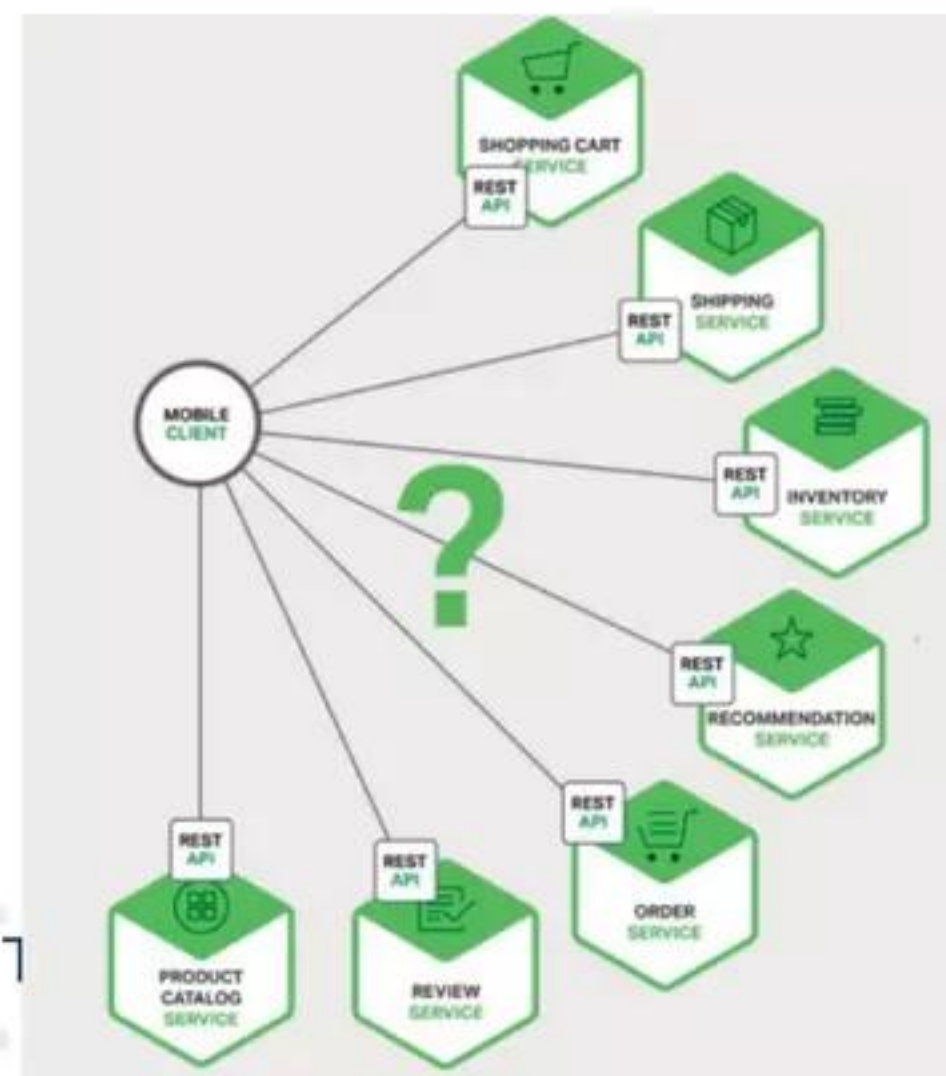

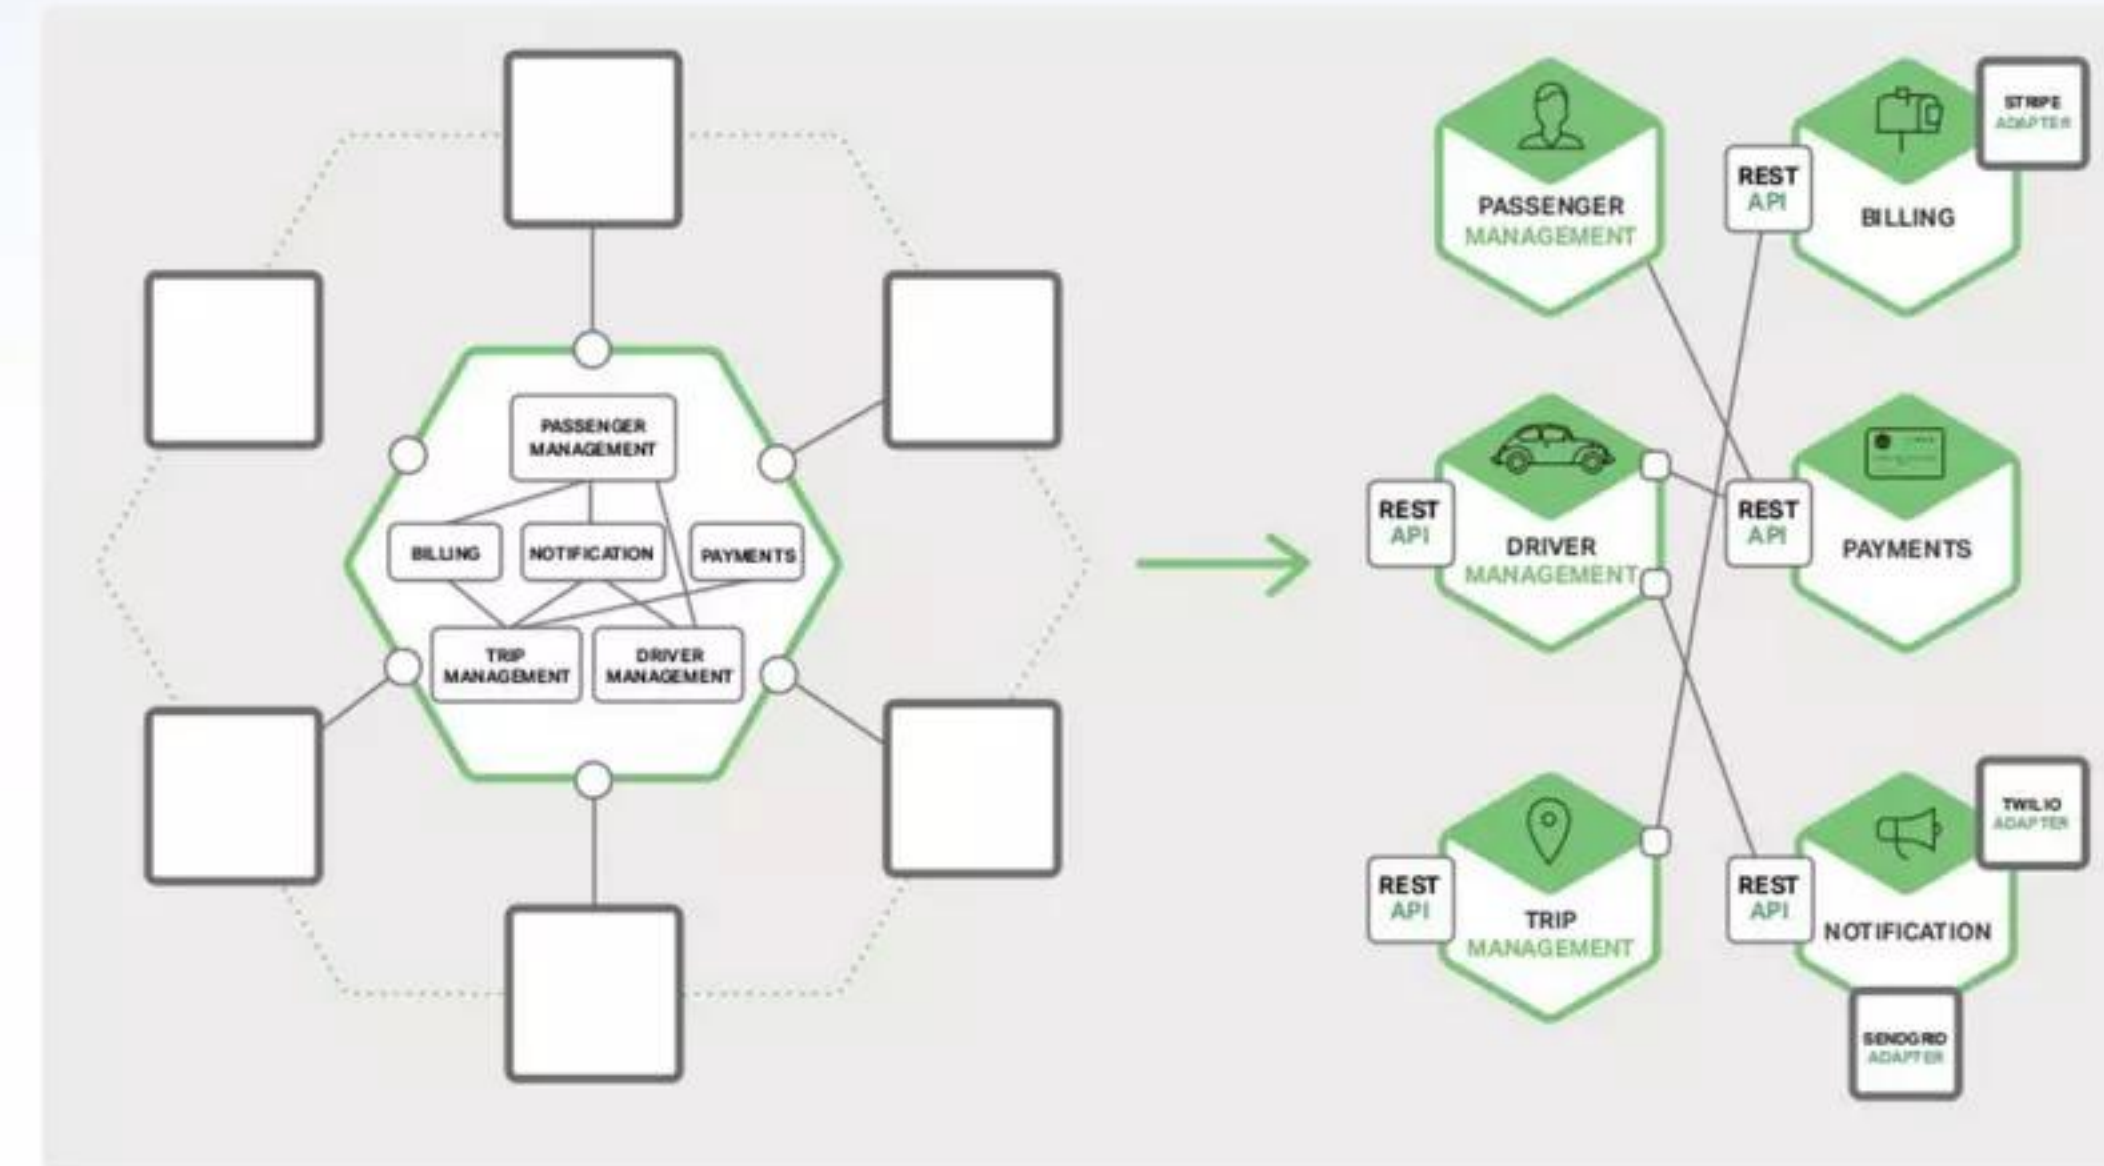

Why microservices?

Wish our system could :

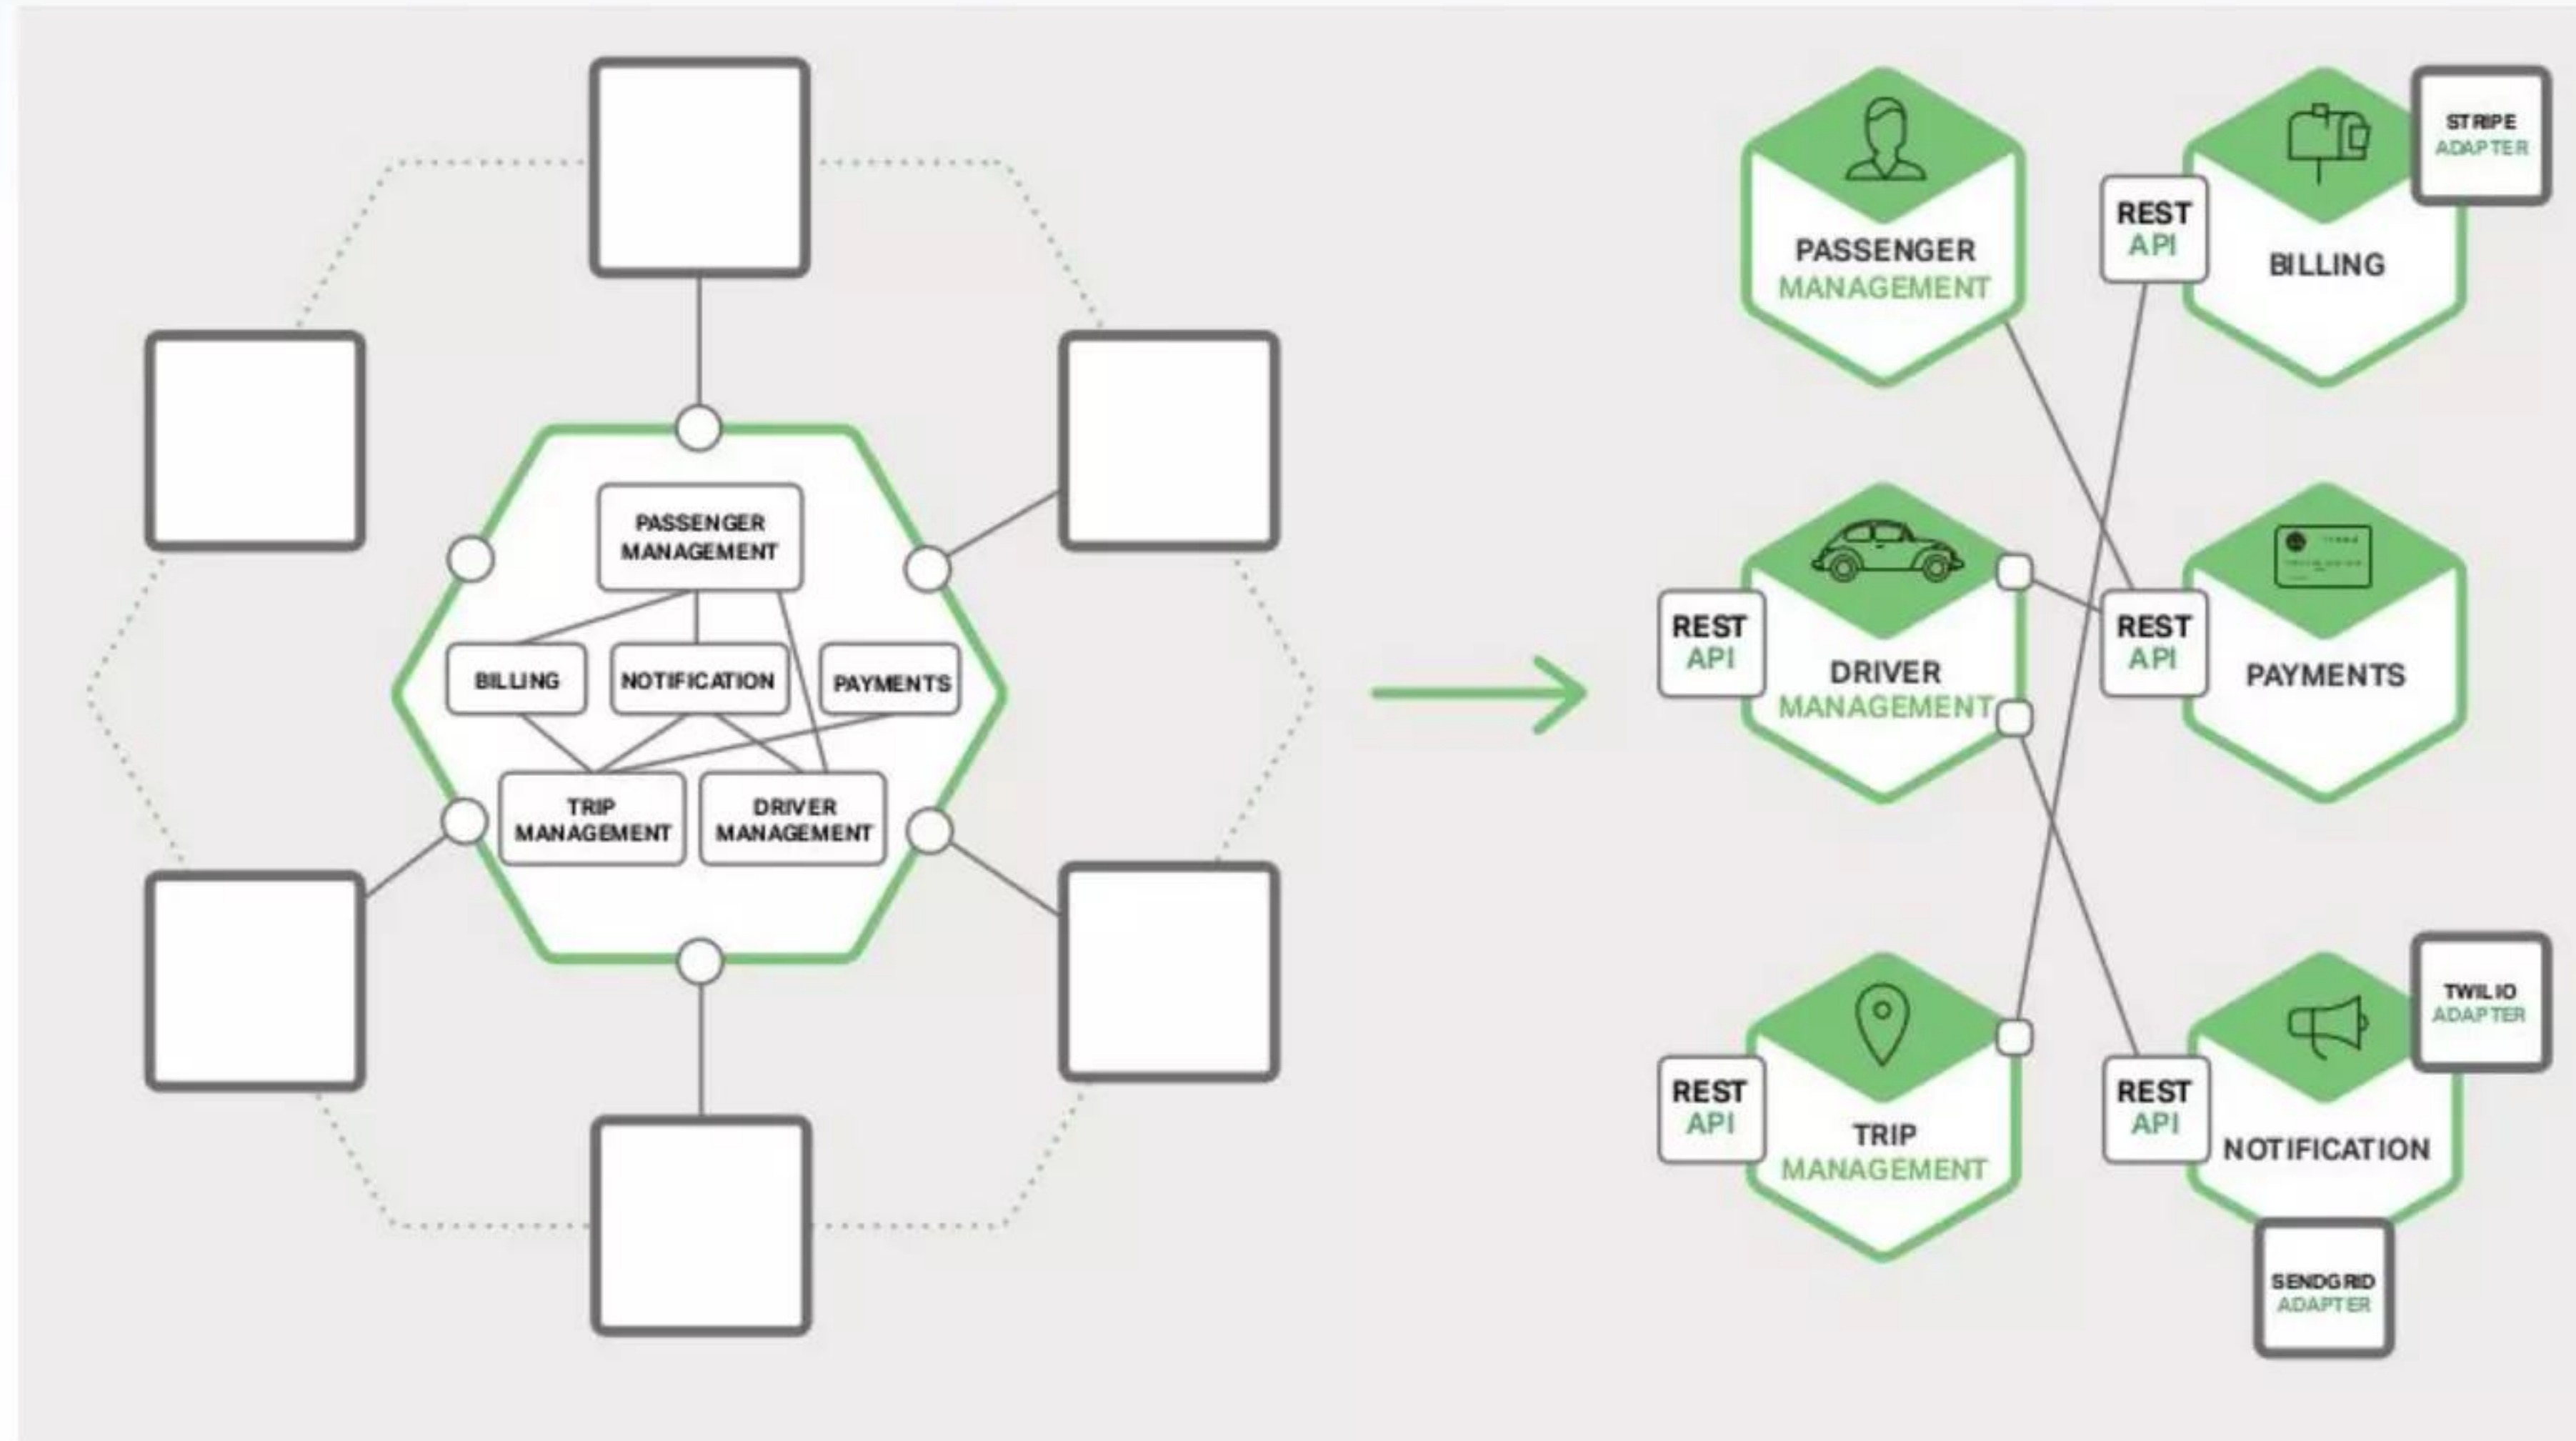

- Small so more modular, tackles the complexity issue. Lightweight
- Reusability
- Reliable
- Each service independent :
 - loosely coupled
 - Scalability

Challenge microservices?

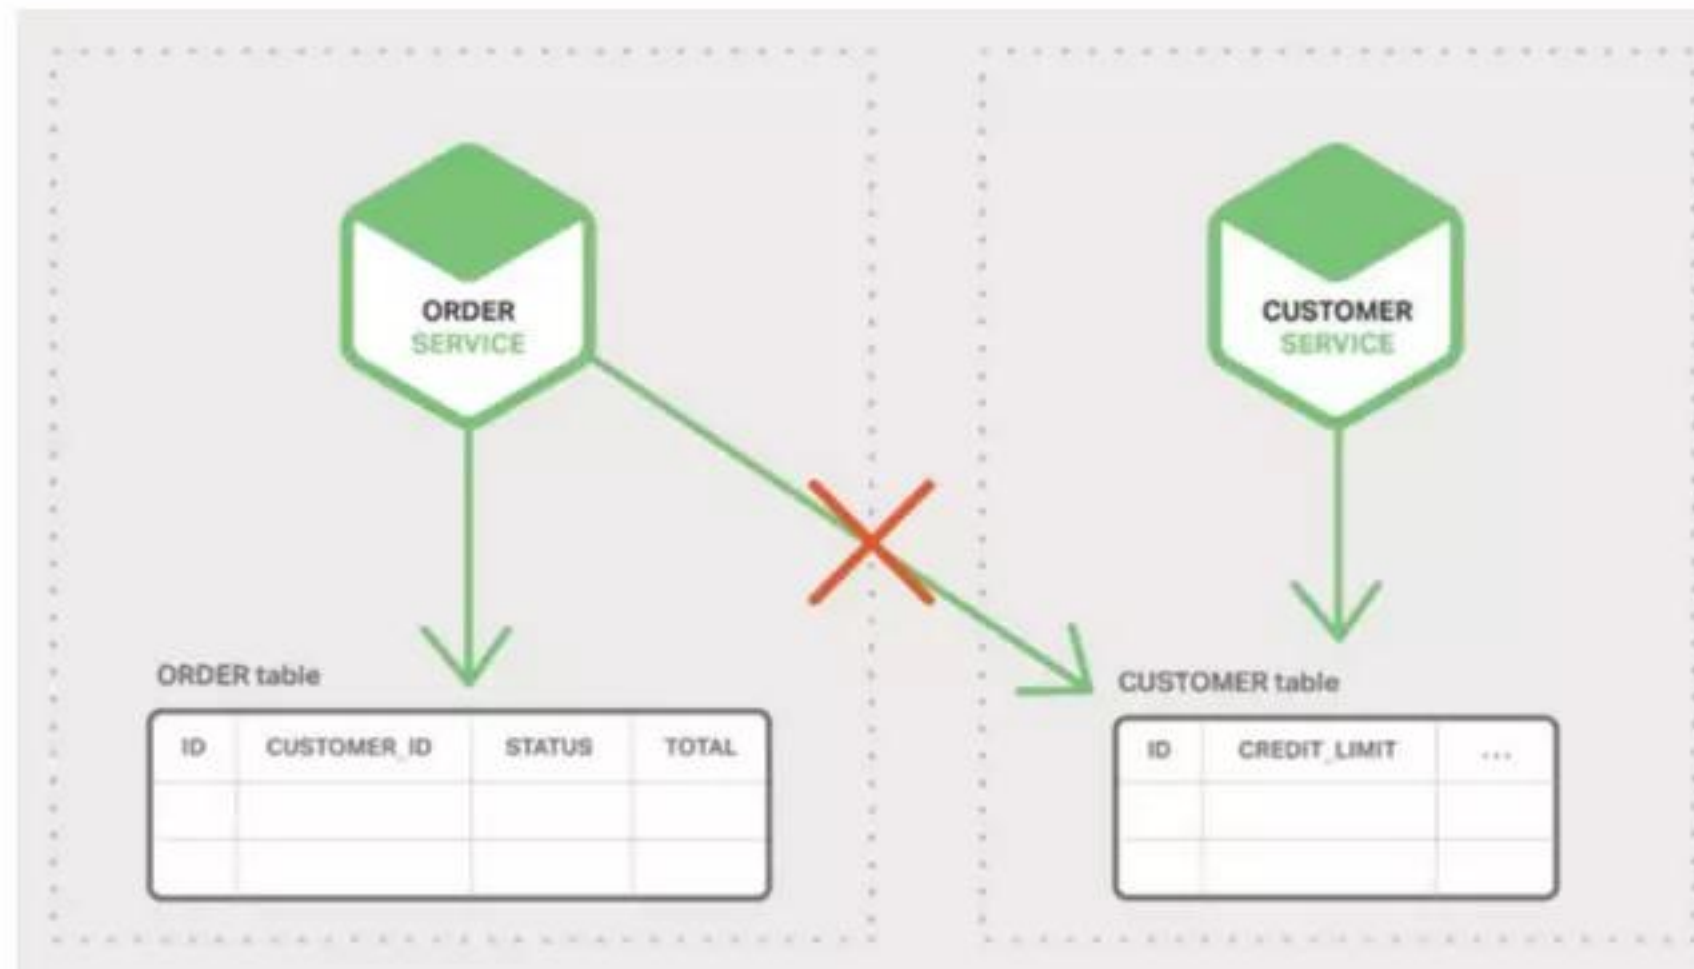

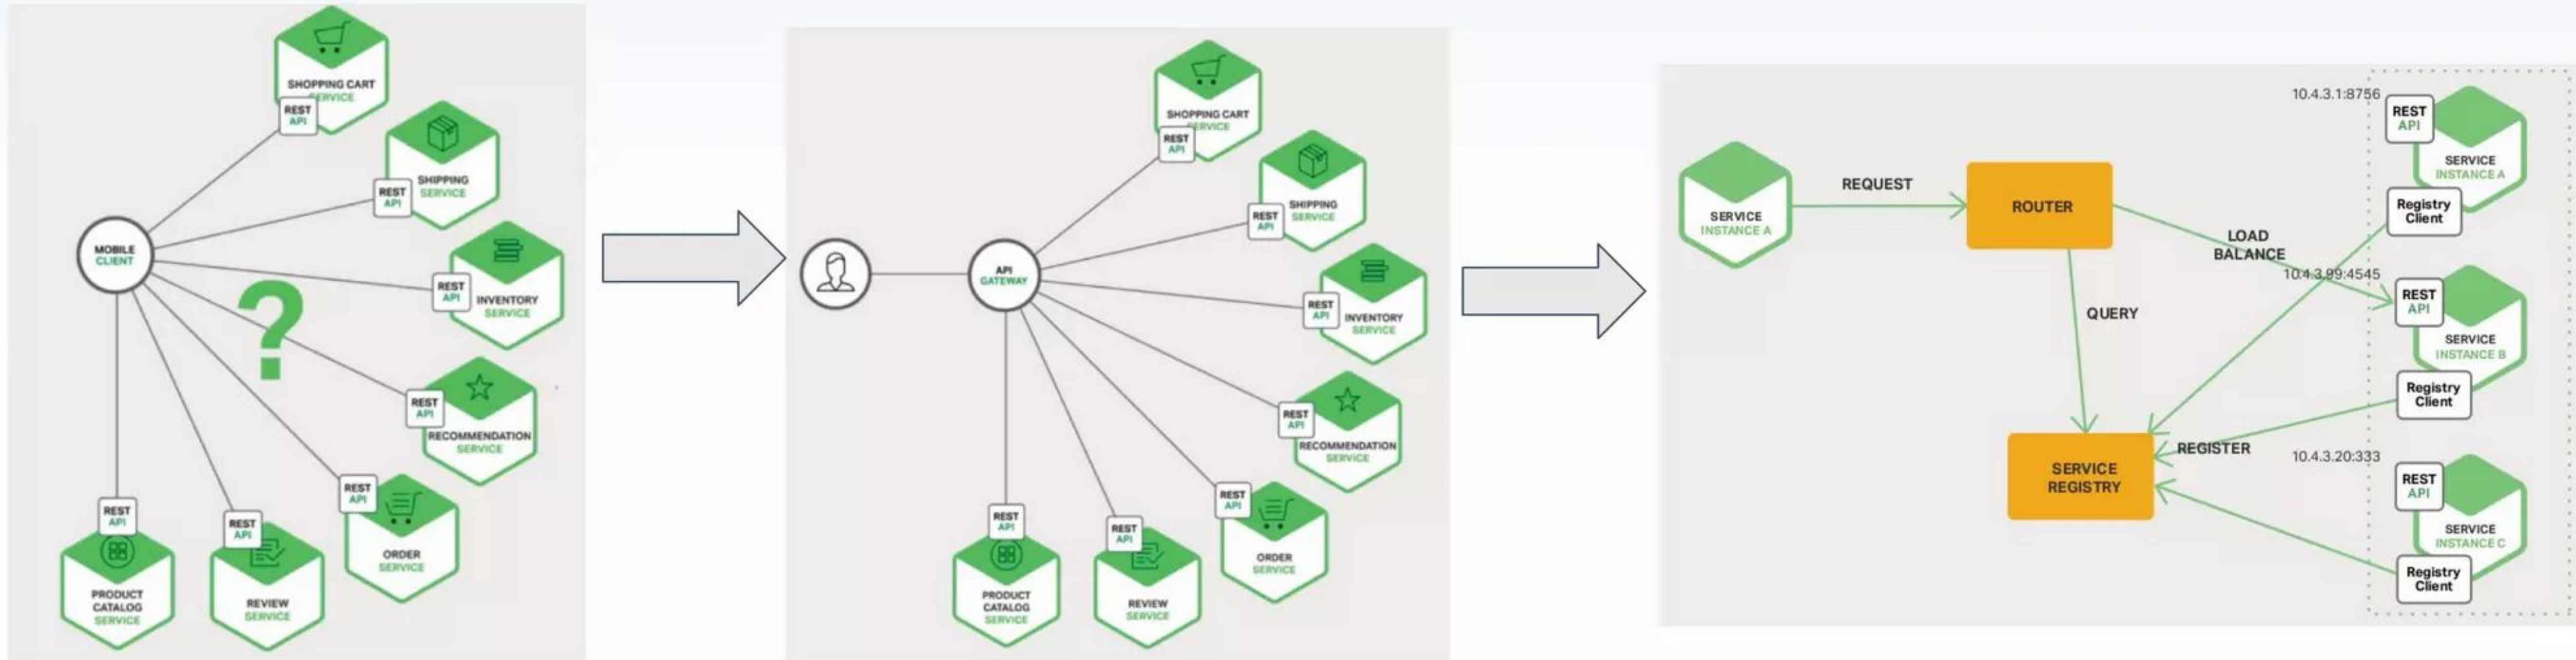

- Communication : Latency and complexity
- Database: each services have their own database, transaction
- Testing: Integration testing
- Changes: could impact multiple services
- Deployment: machines x services, configuration, secrets management, monitoring

Communication

Communication

Orchestration

Entails actively controlling all elements and interactions like a conductor directs the musicians of an orchestra

One service controller handles all communications between microservices, and directs each service to perform the intended function.

Disadvantage :

- the controller needs to directly communicate with each service and wait for each service's response
- impacted by downstream network and service availability (latency)
- More tight coupling then we could say it's a distributed monolithic.

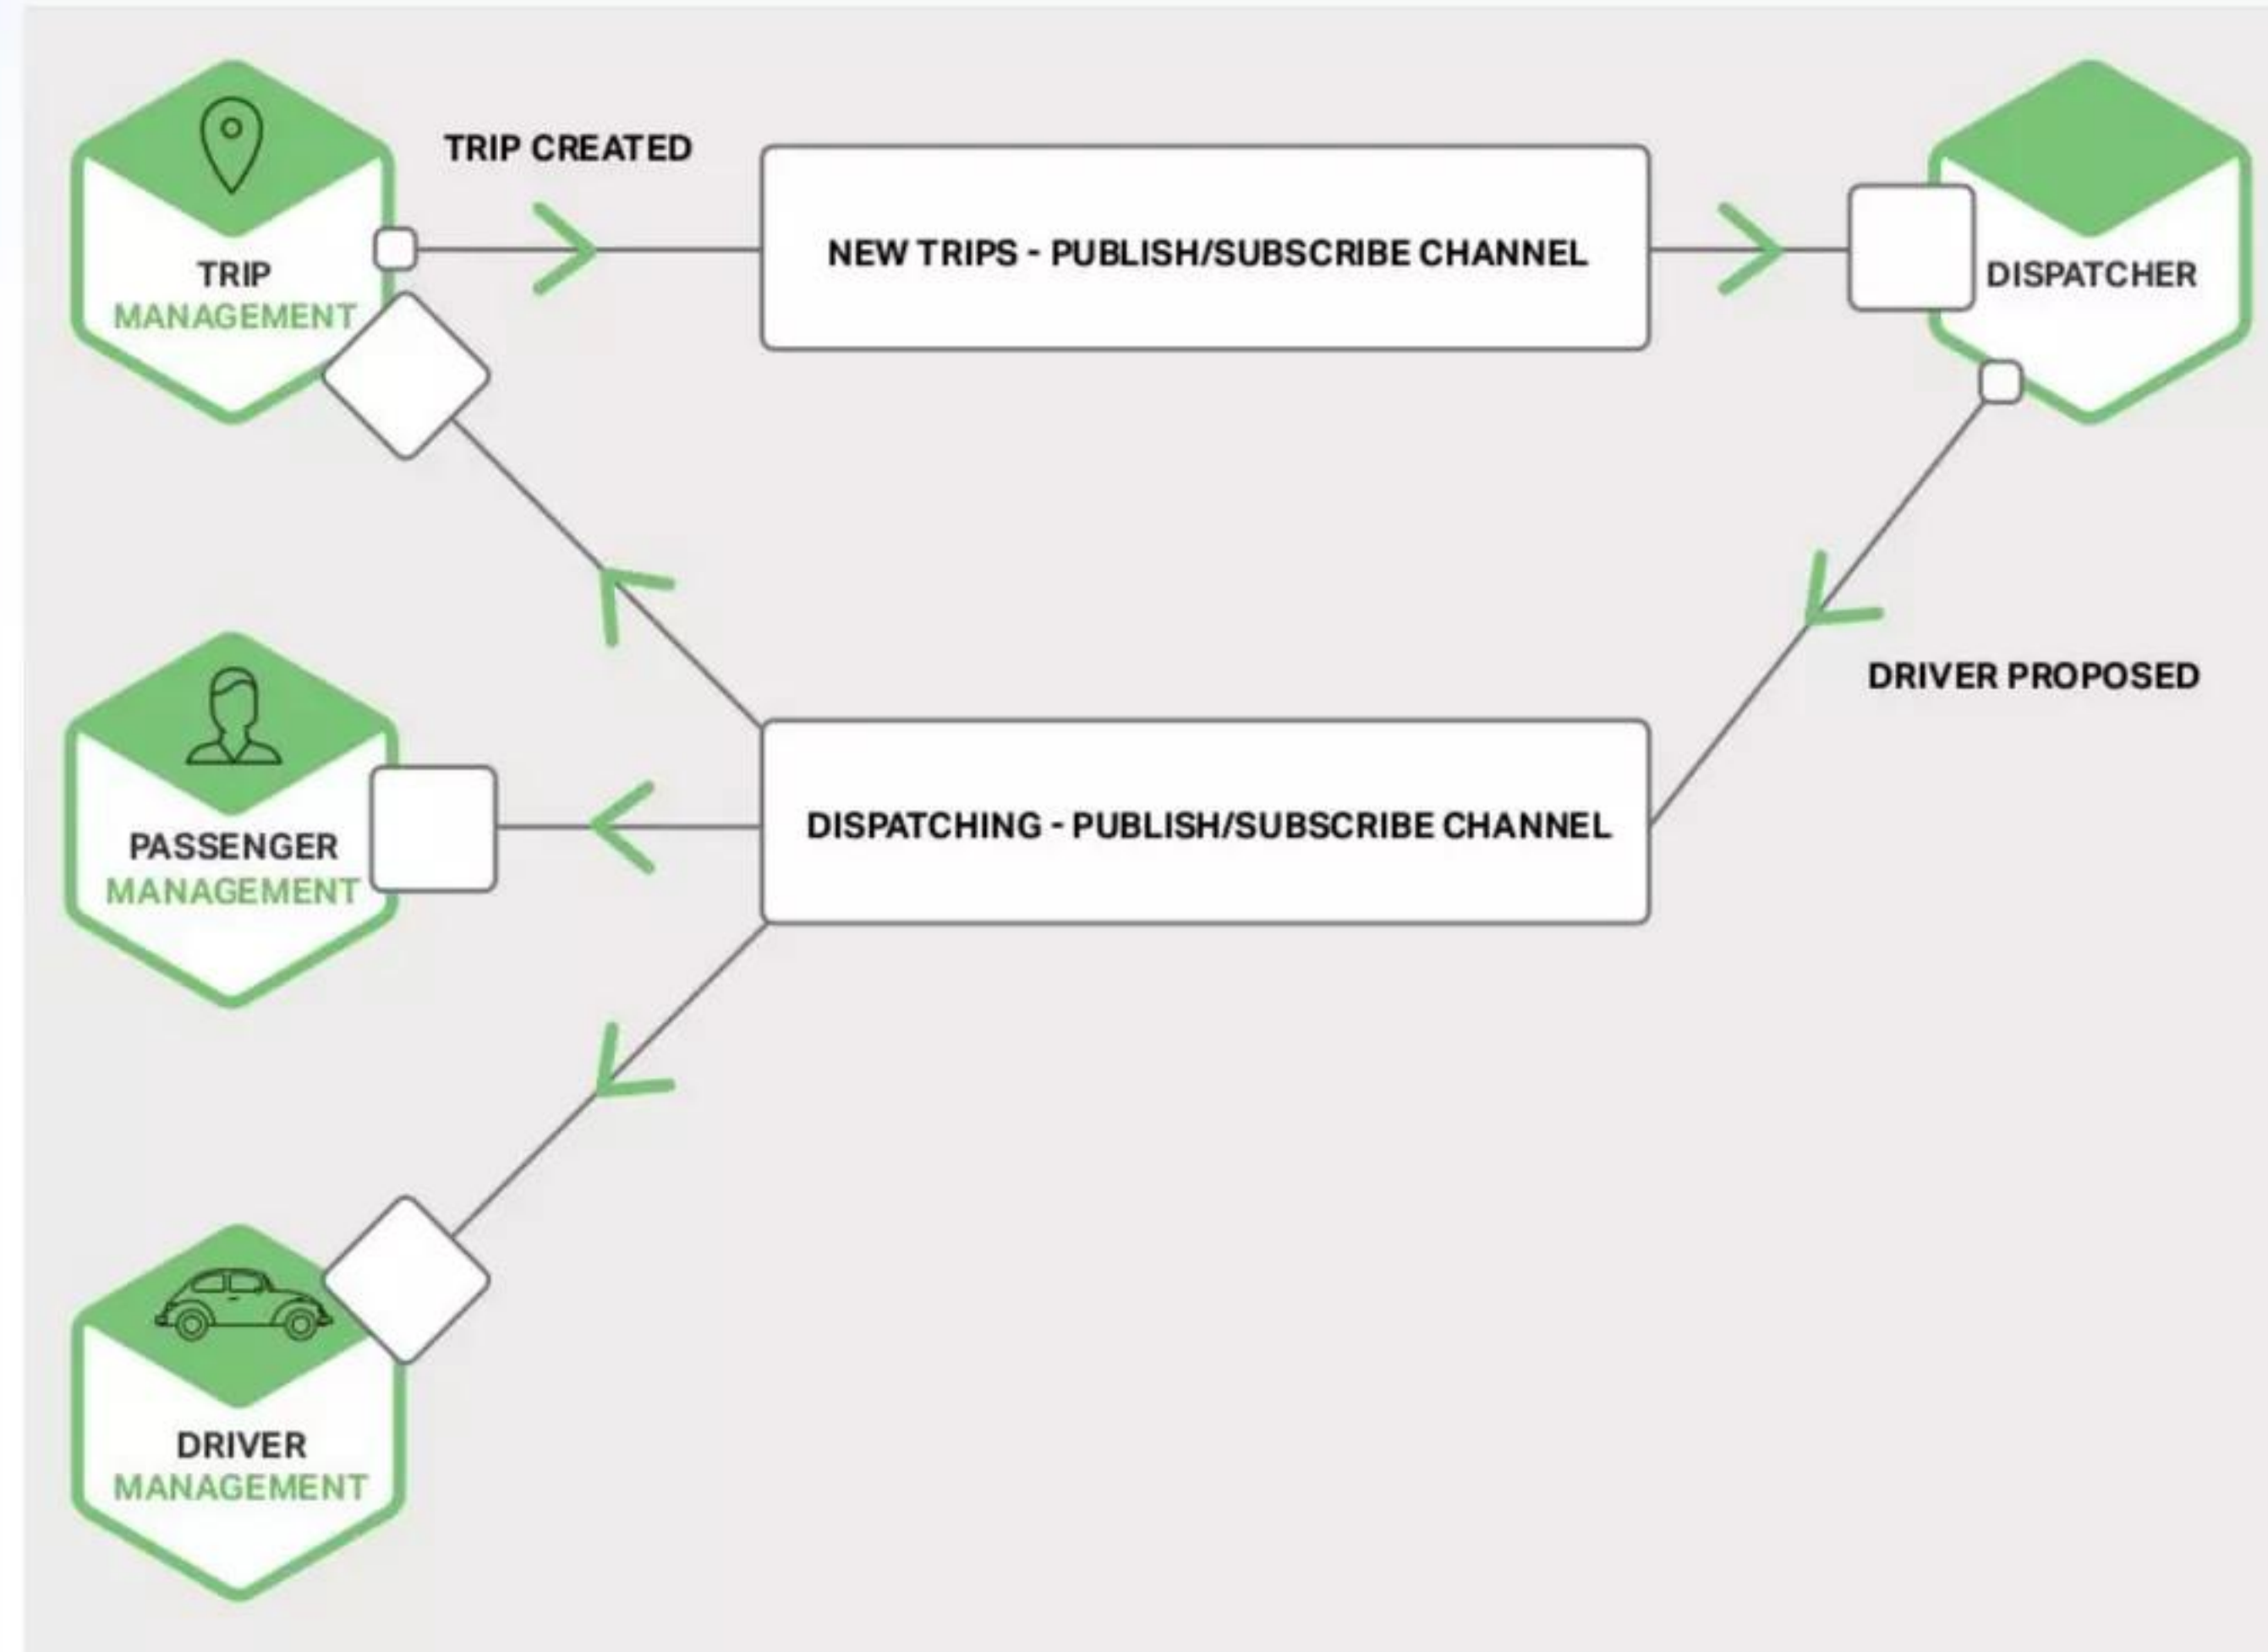

Choreography

Asynchronous process: Each service works independently and consumes the data that relates to it to perform its task.

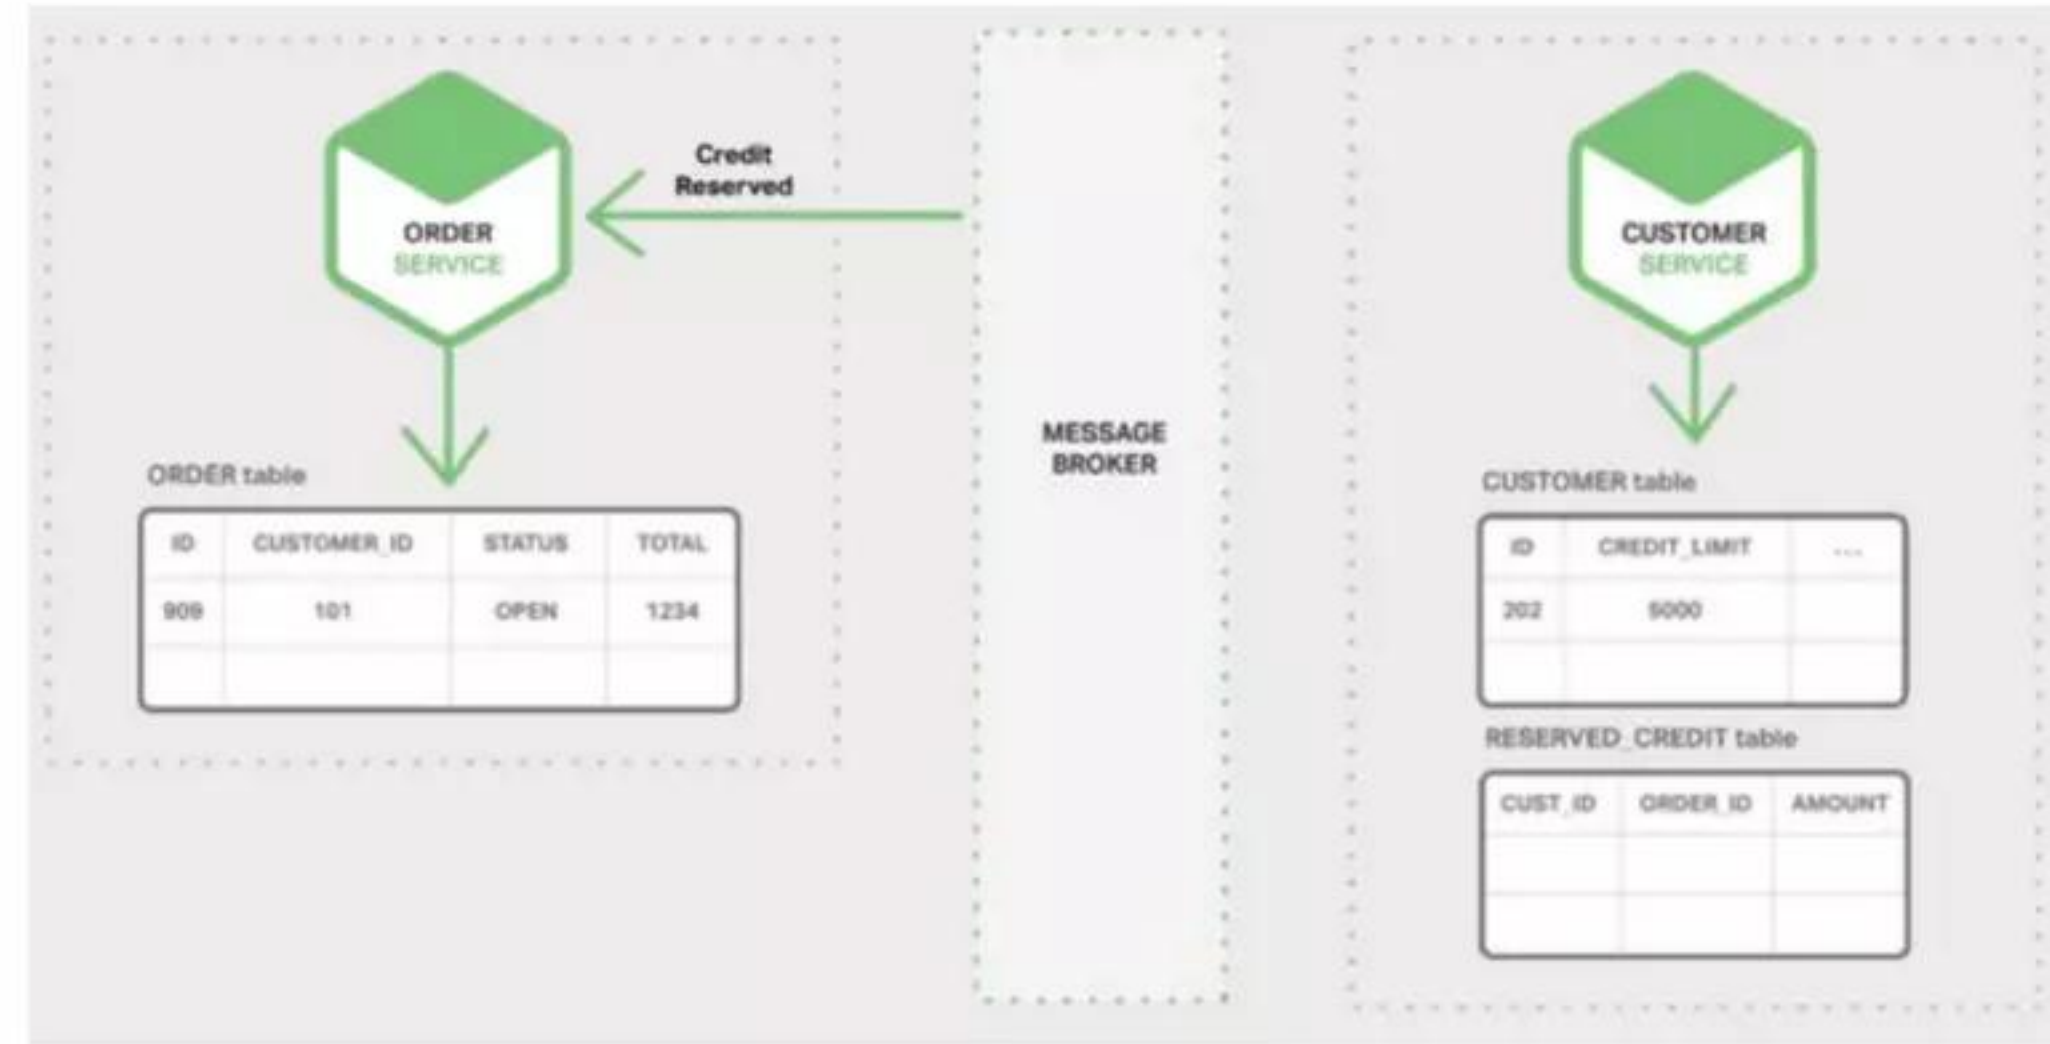

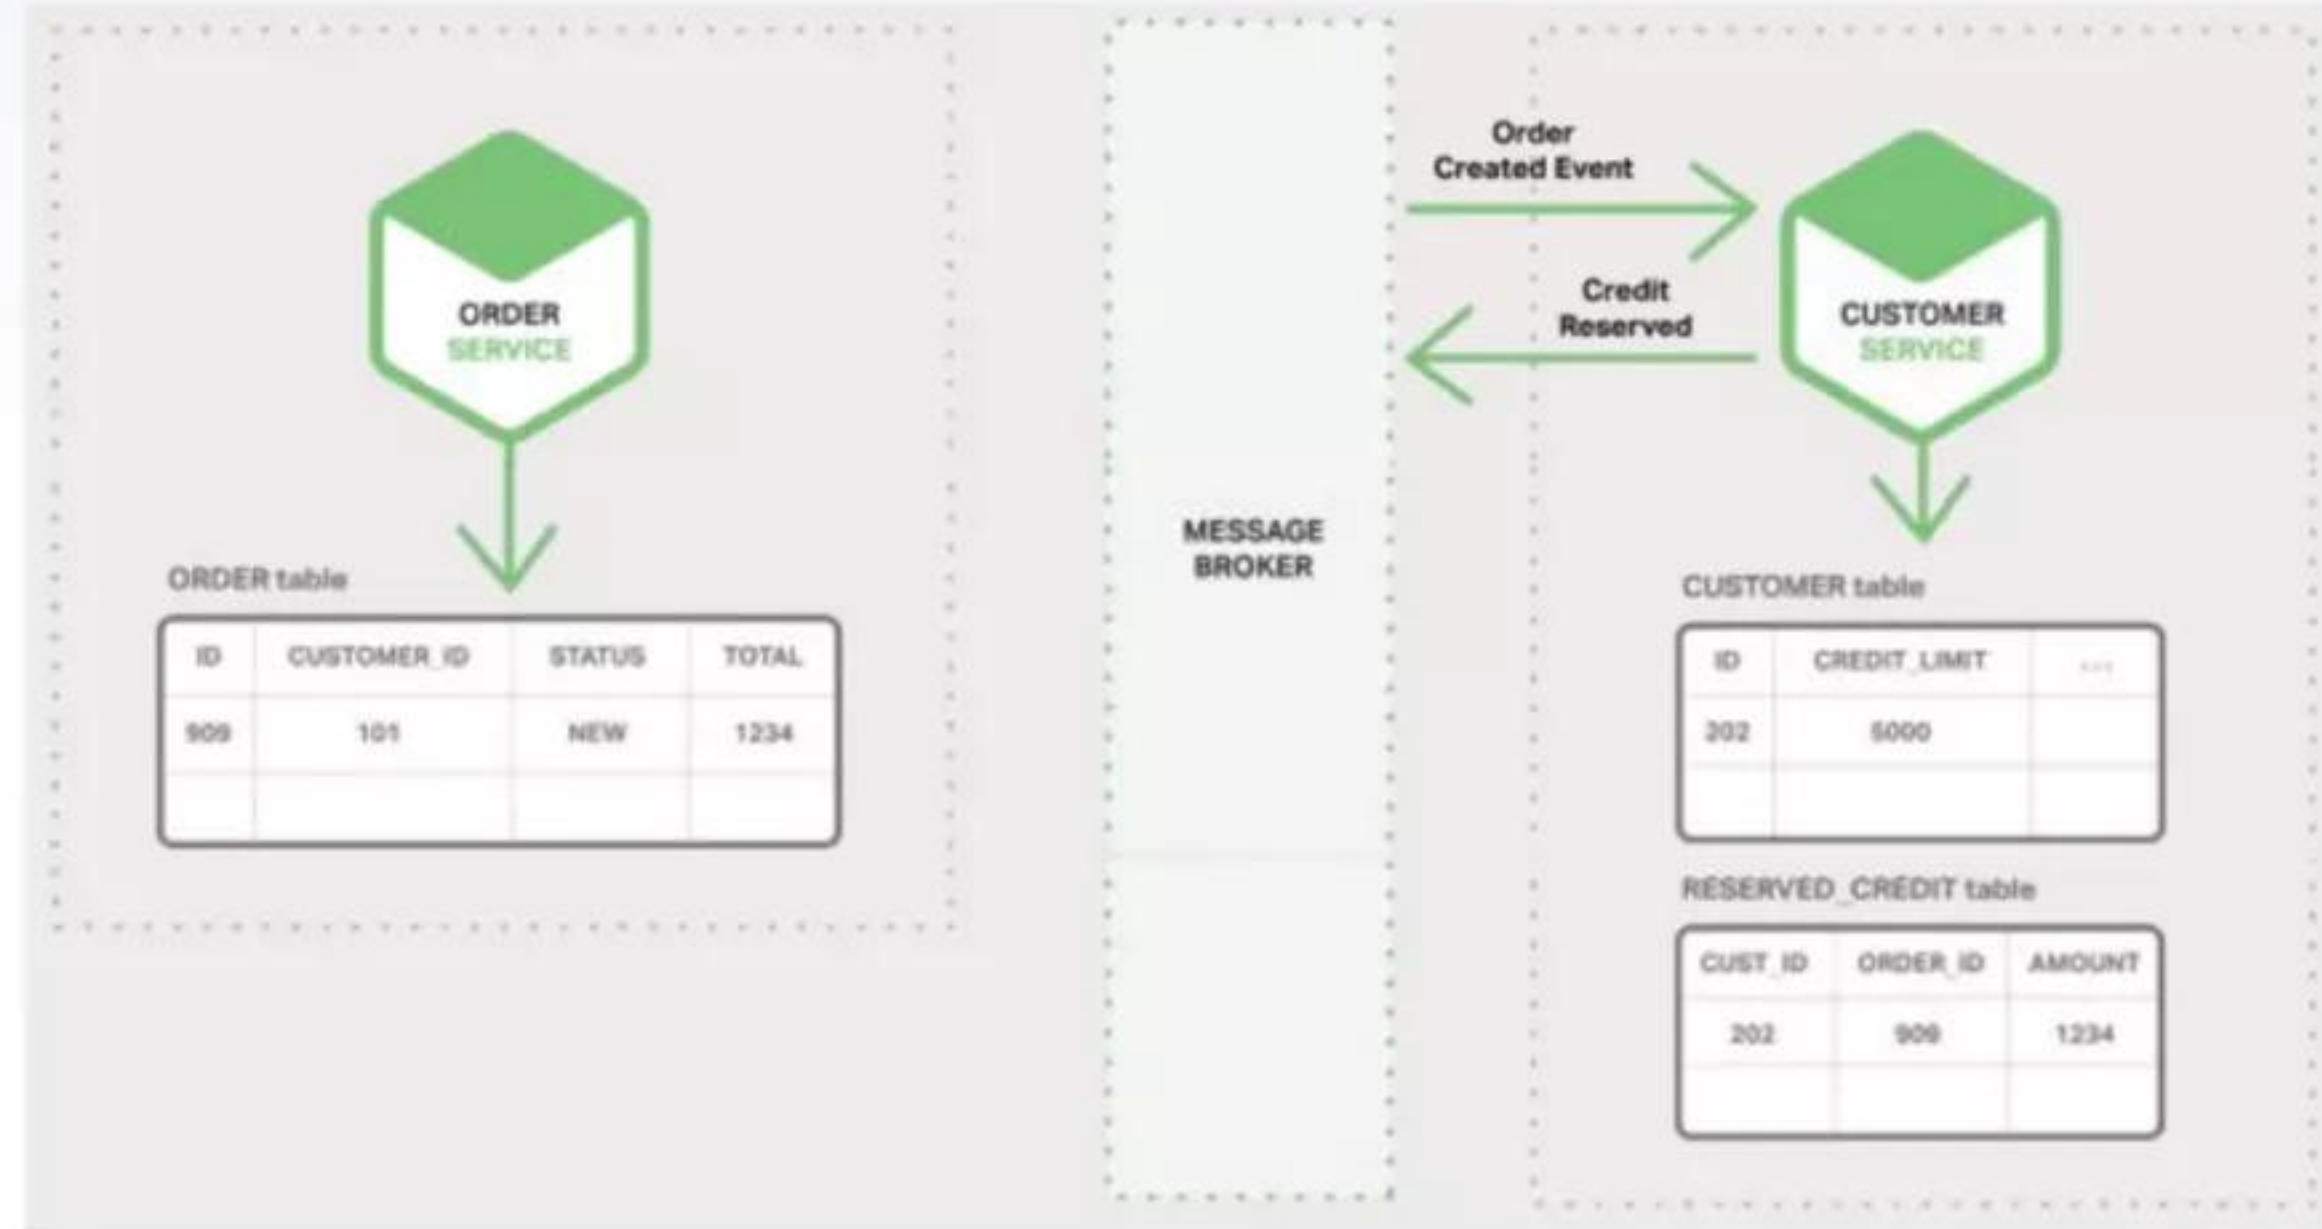

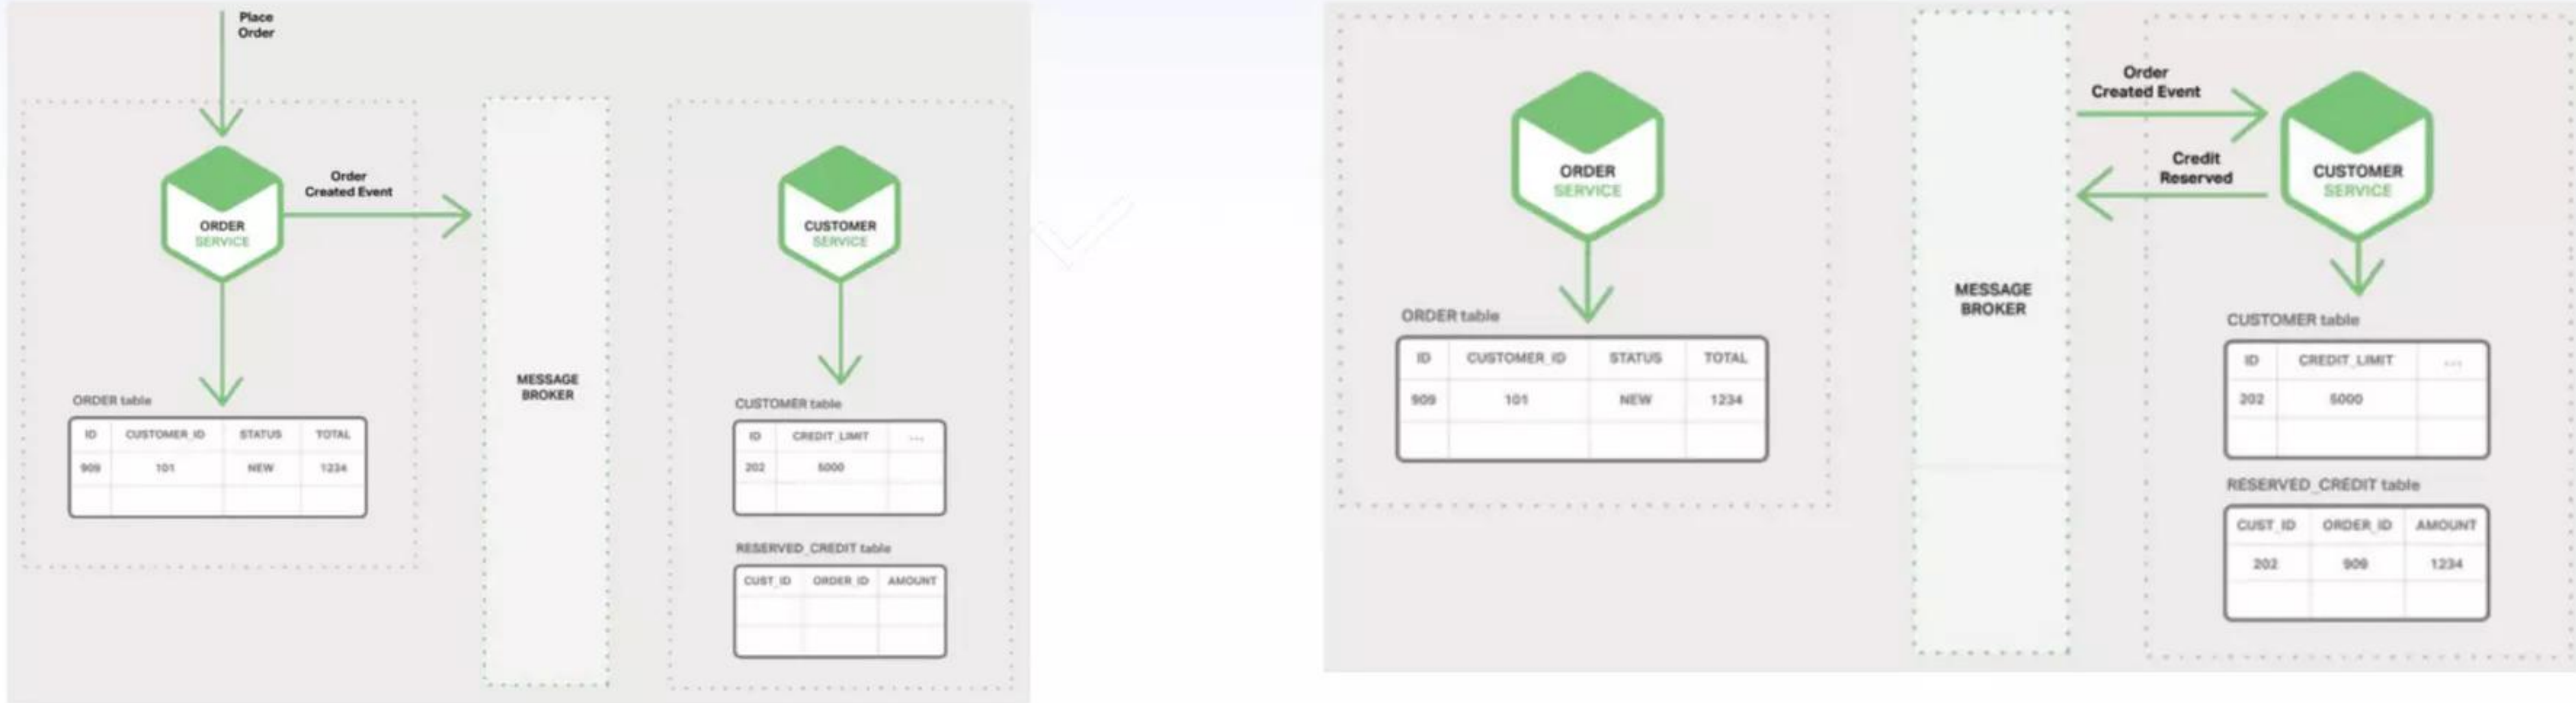

- Event Driven Architecture
- Decouples client from the service
- Message Buffering
- Flexible style

Tech: RabbitMQ, Apache Kafka, ActiveMQ, etc

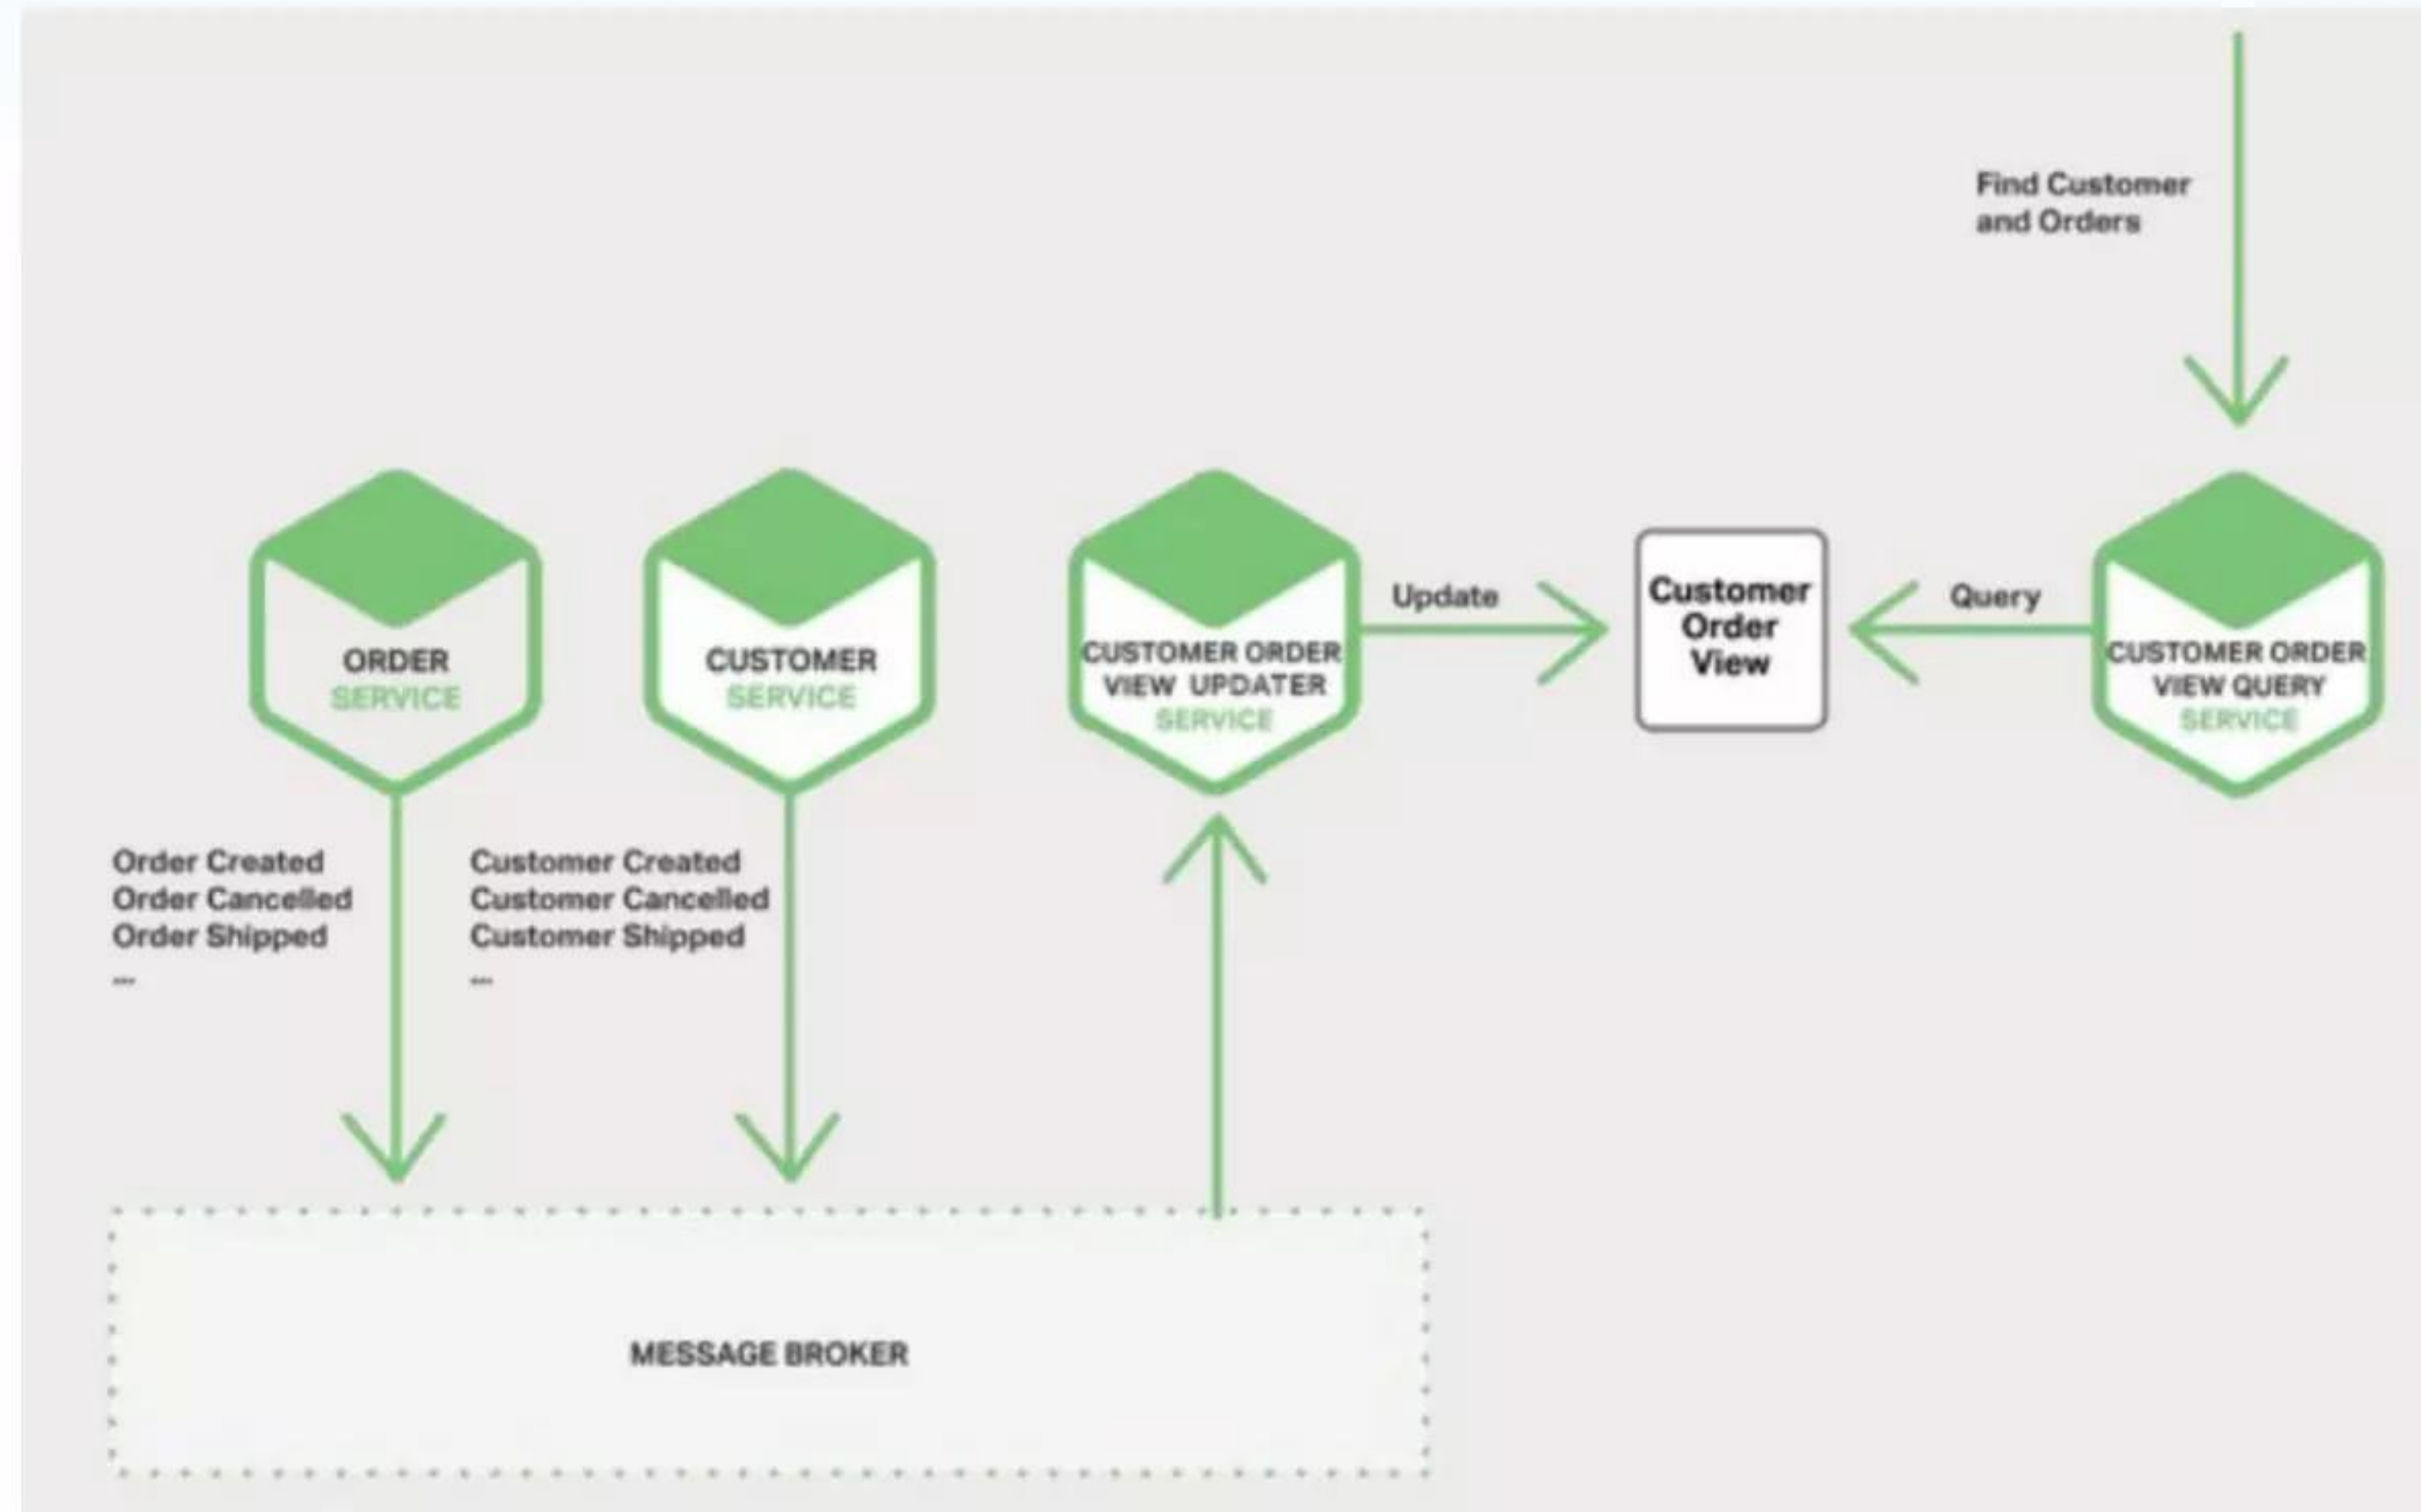

Event Driven #1

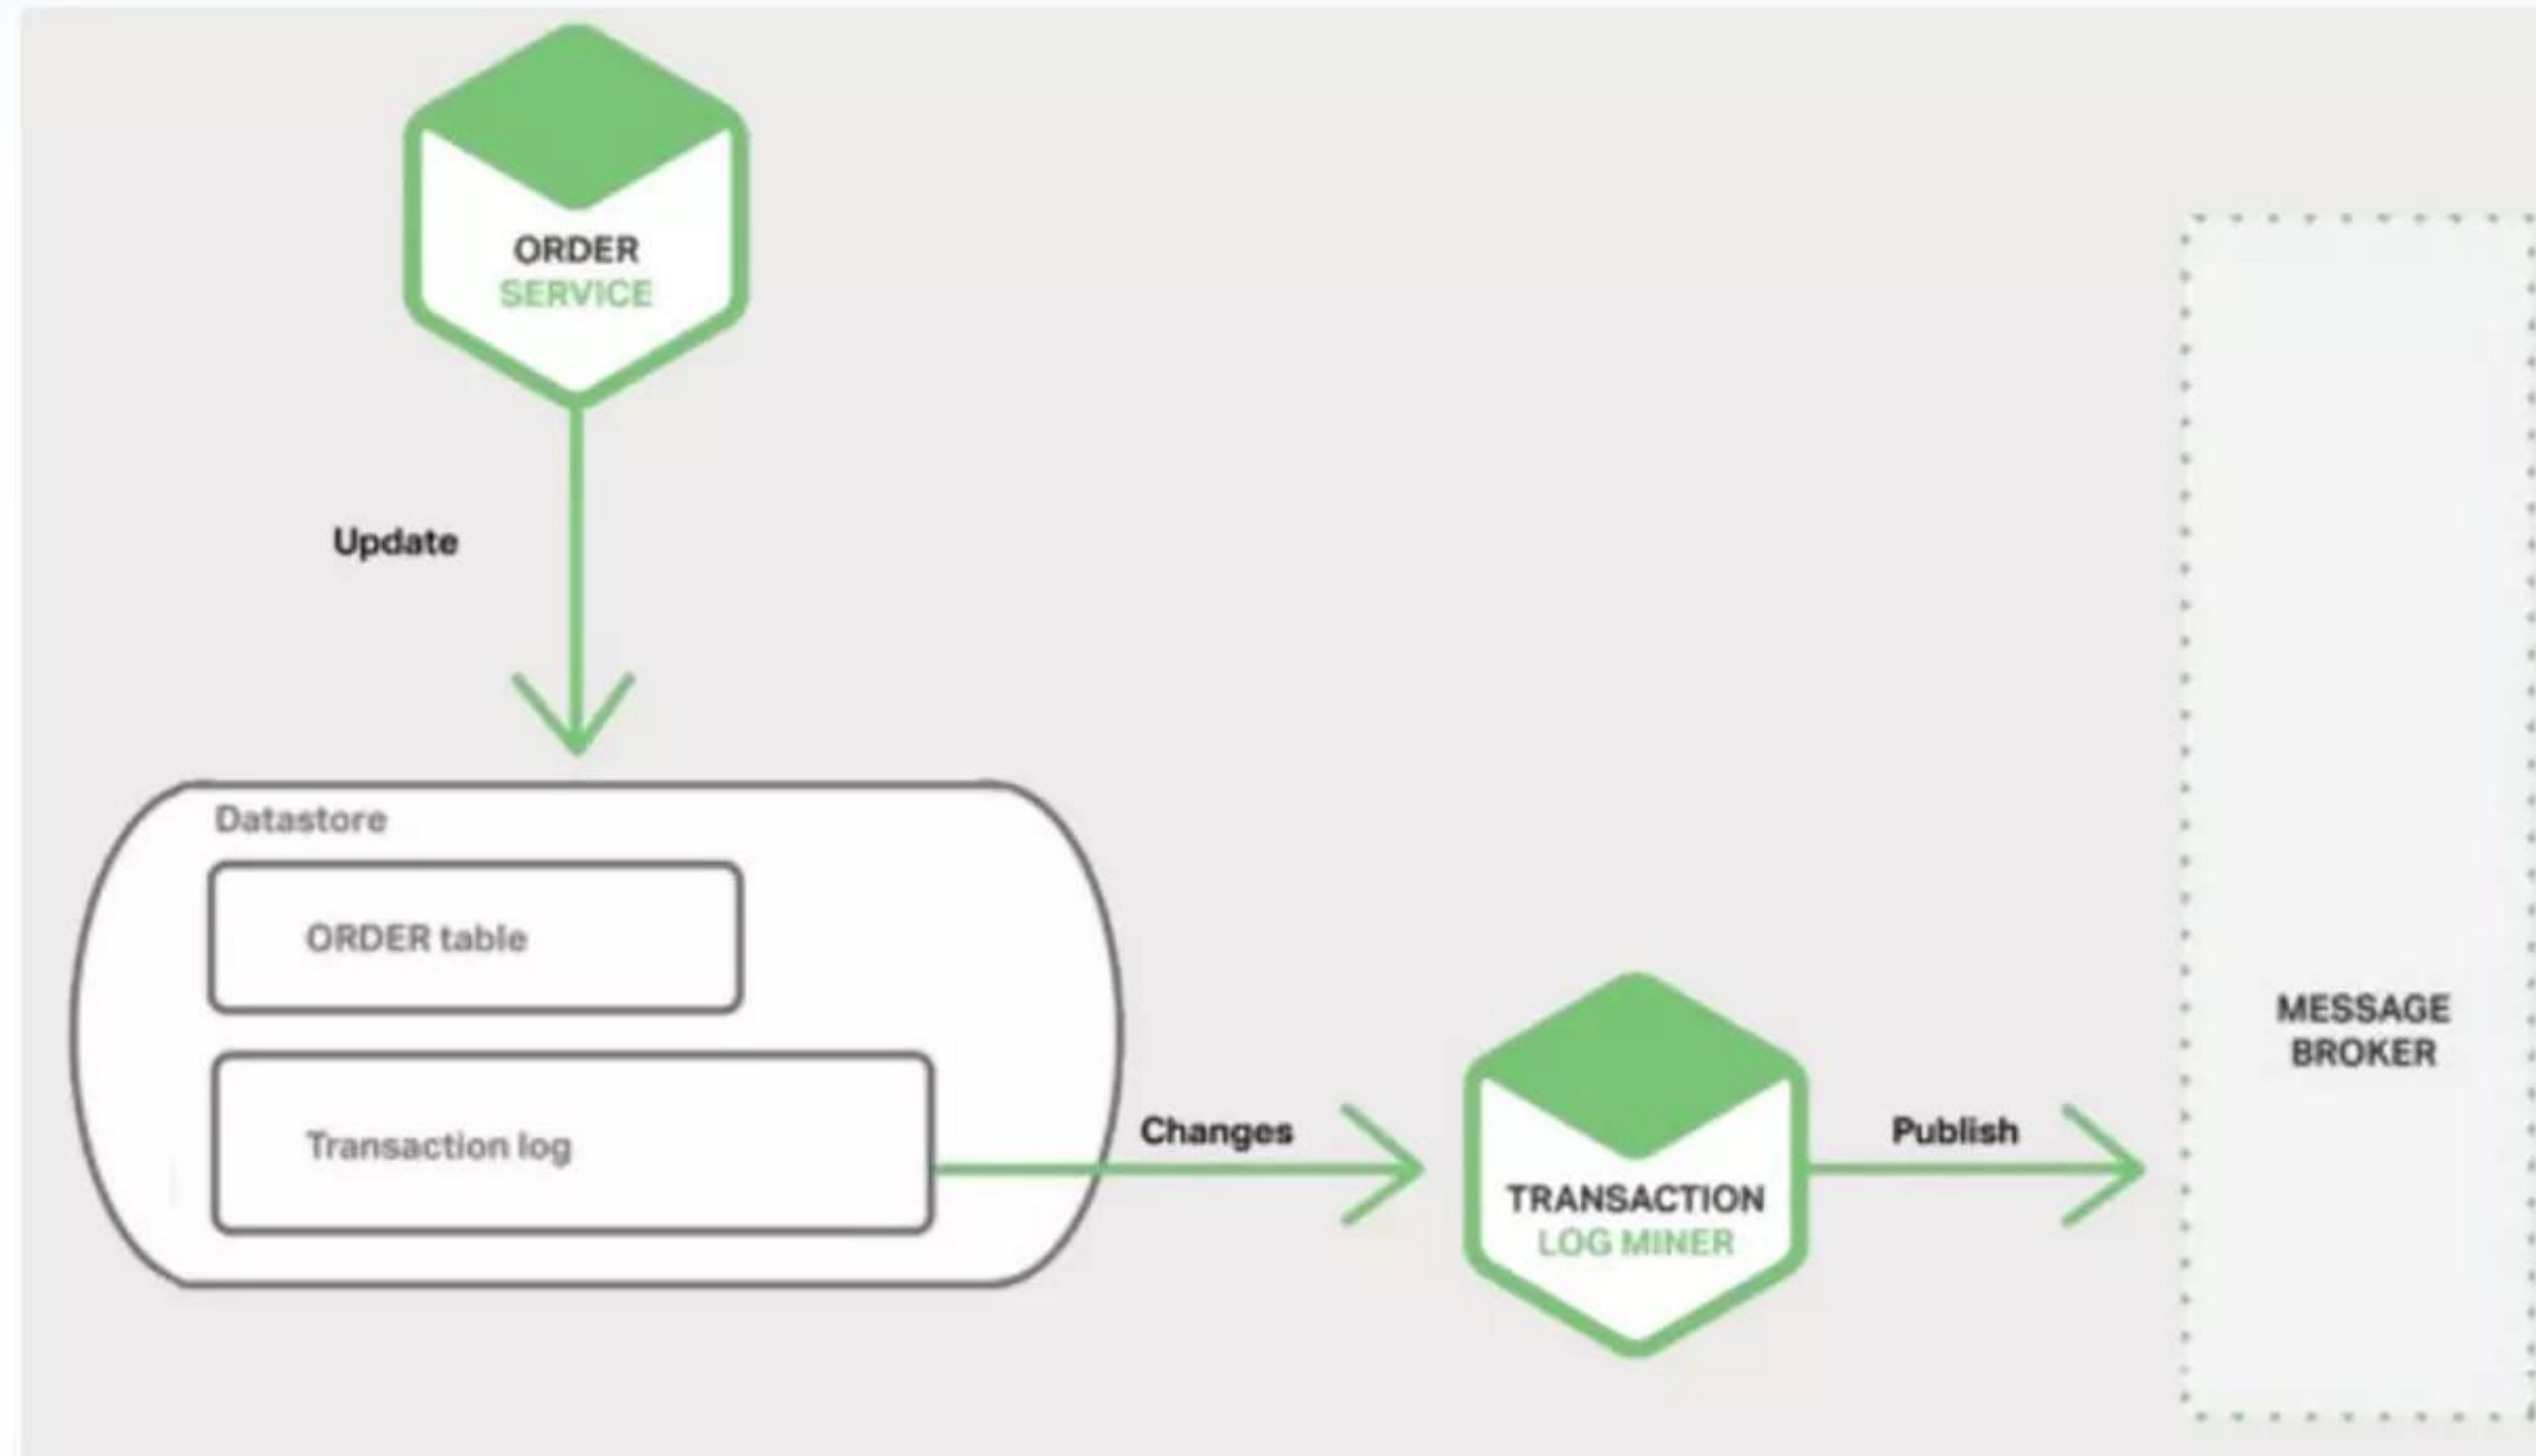

Event Driven #2 (communications)

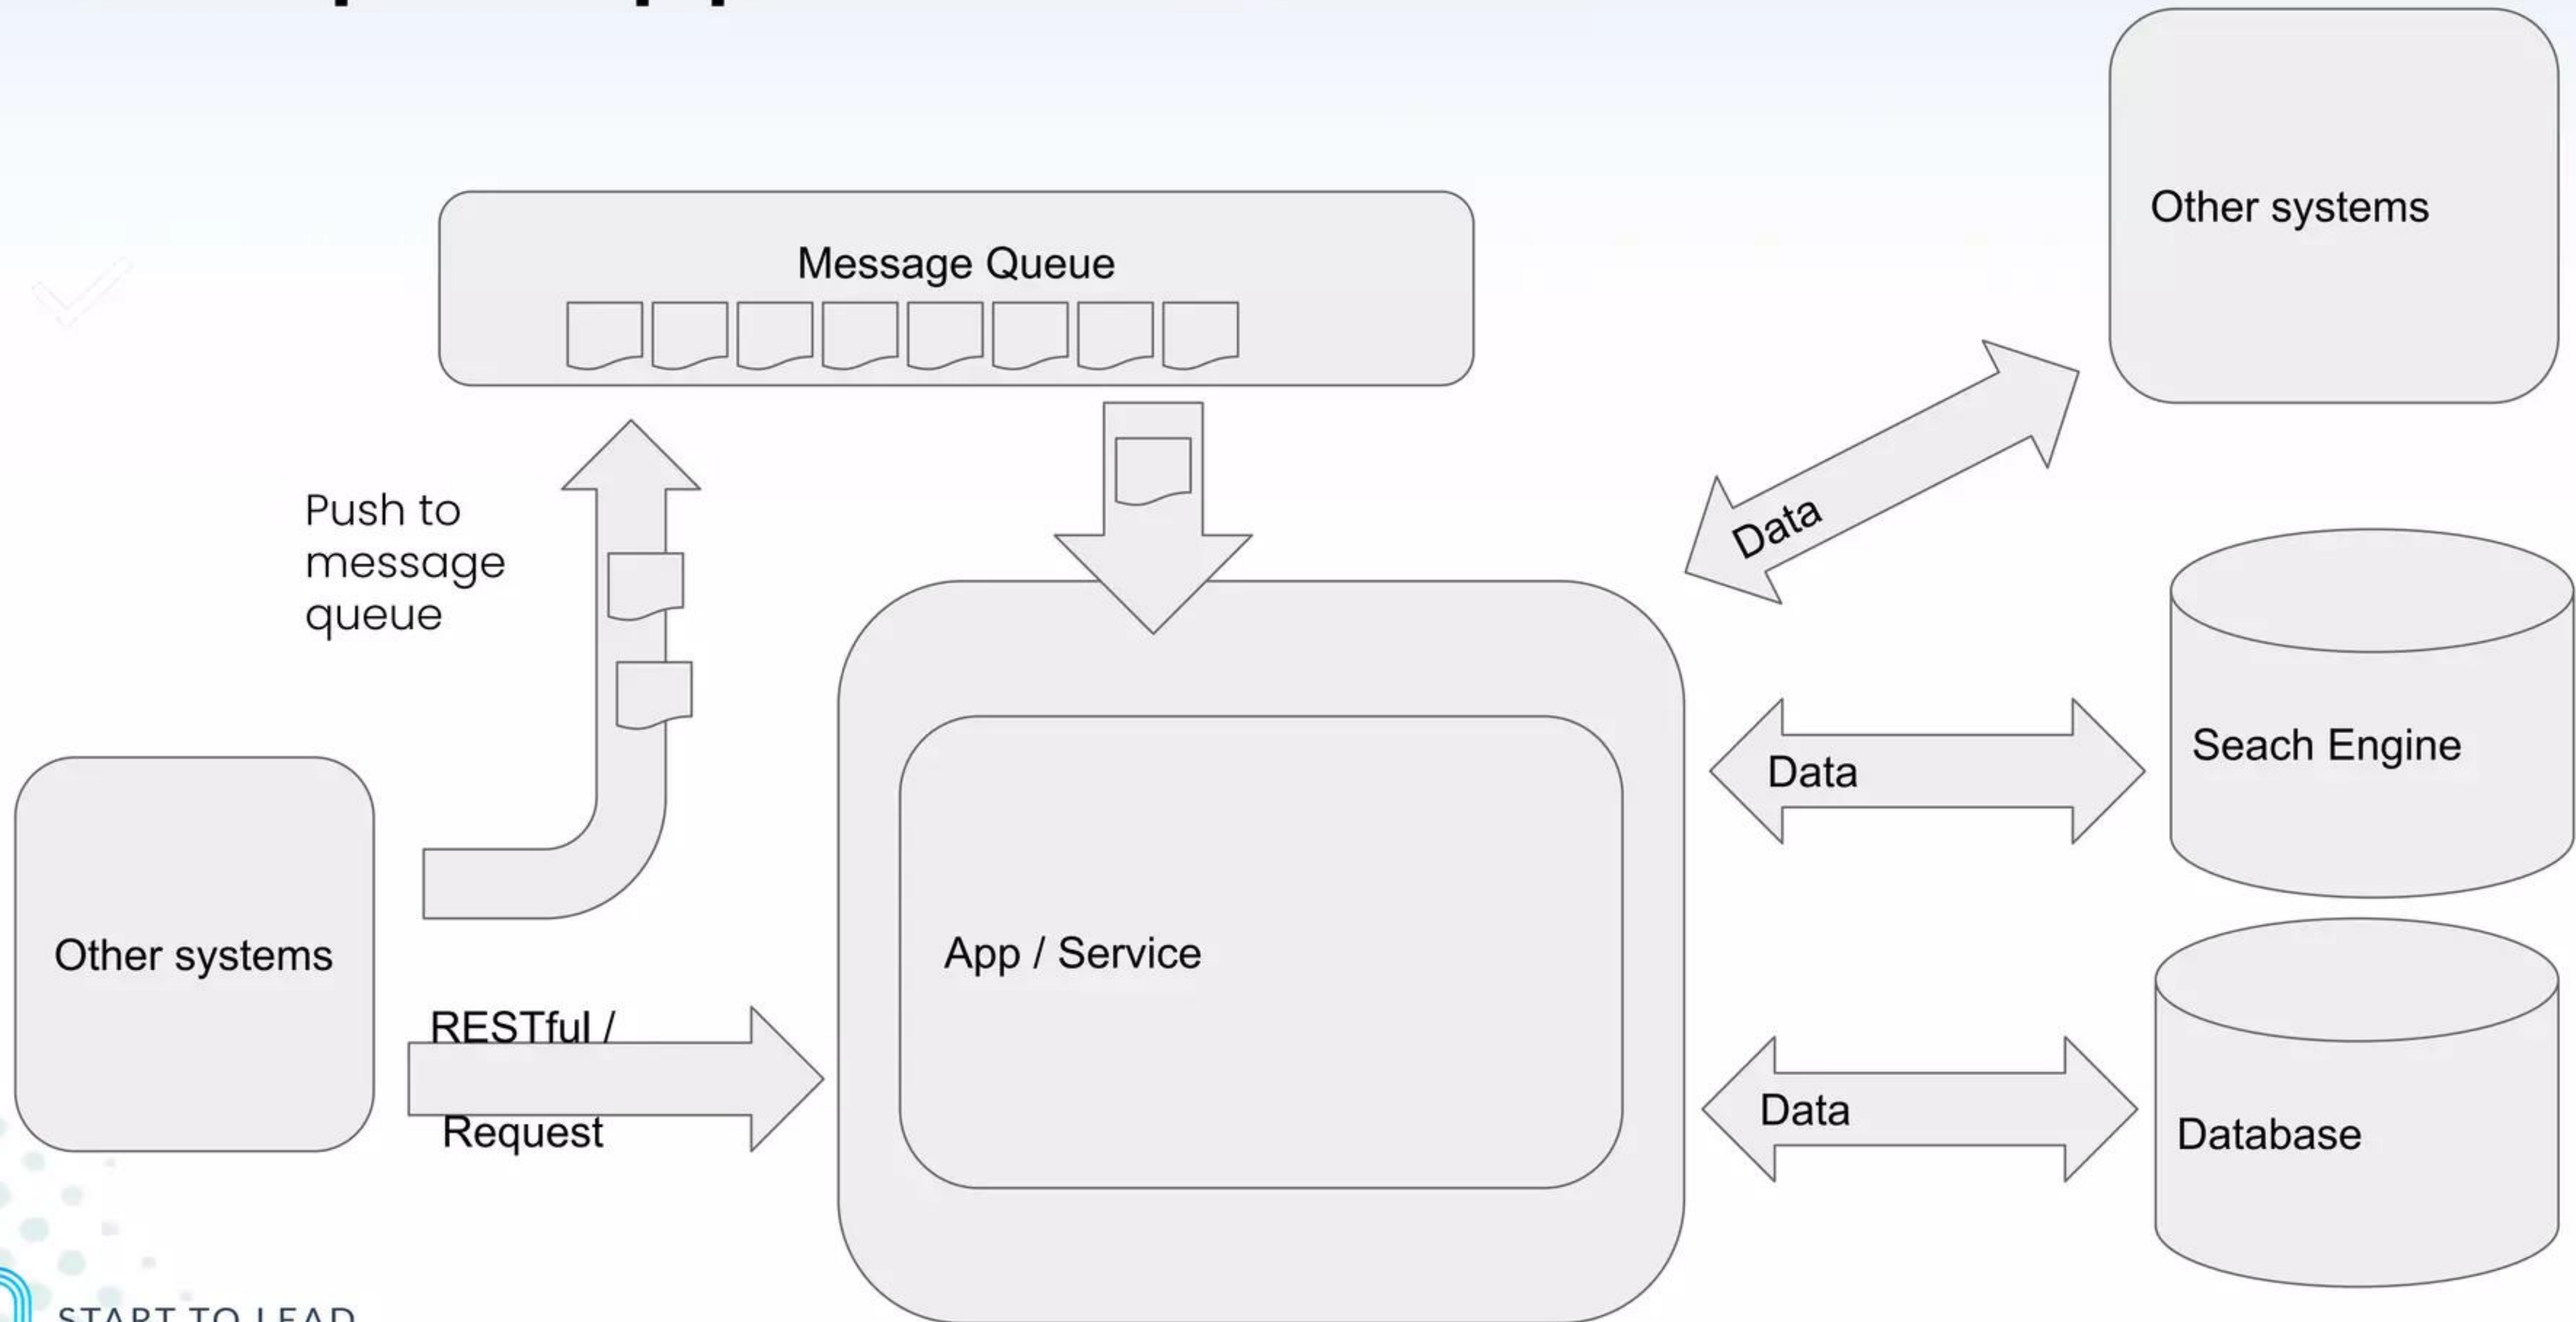

Event Driven (Data Aggregation)

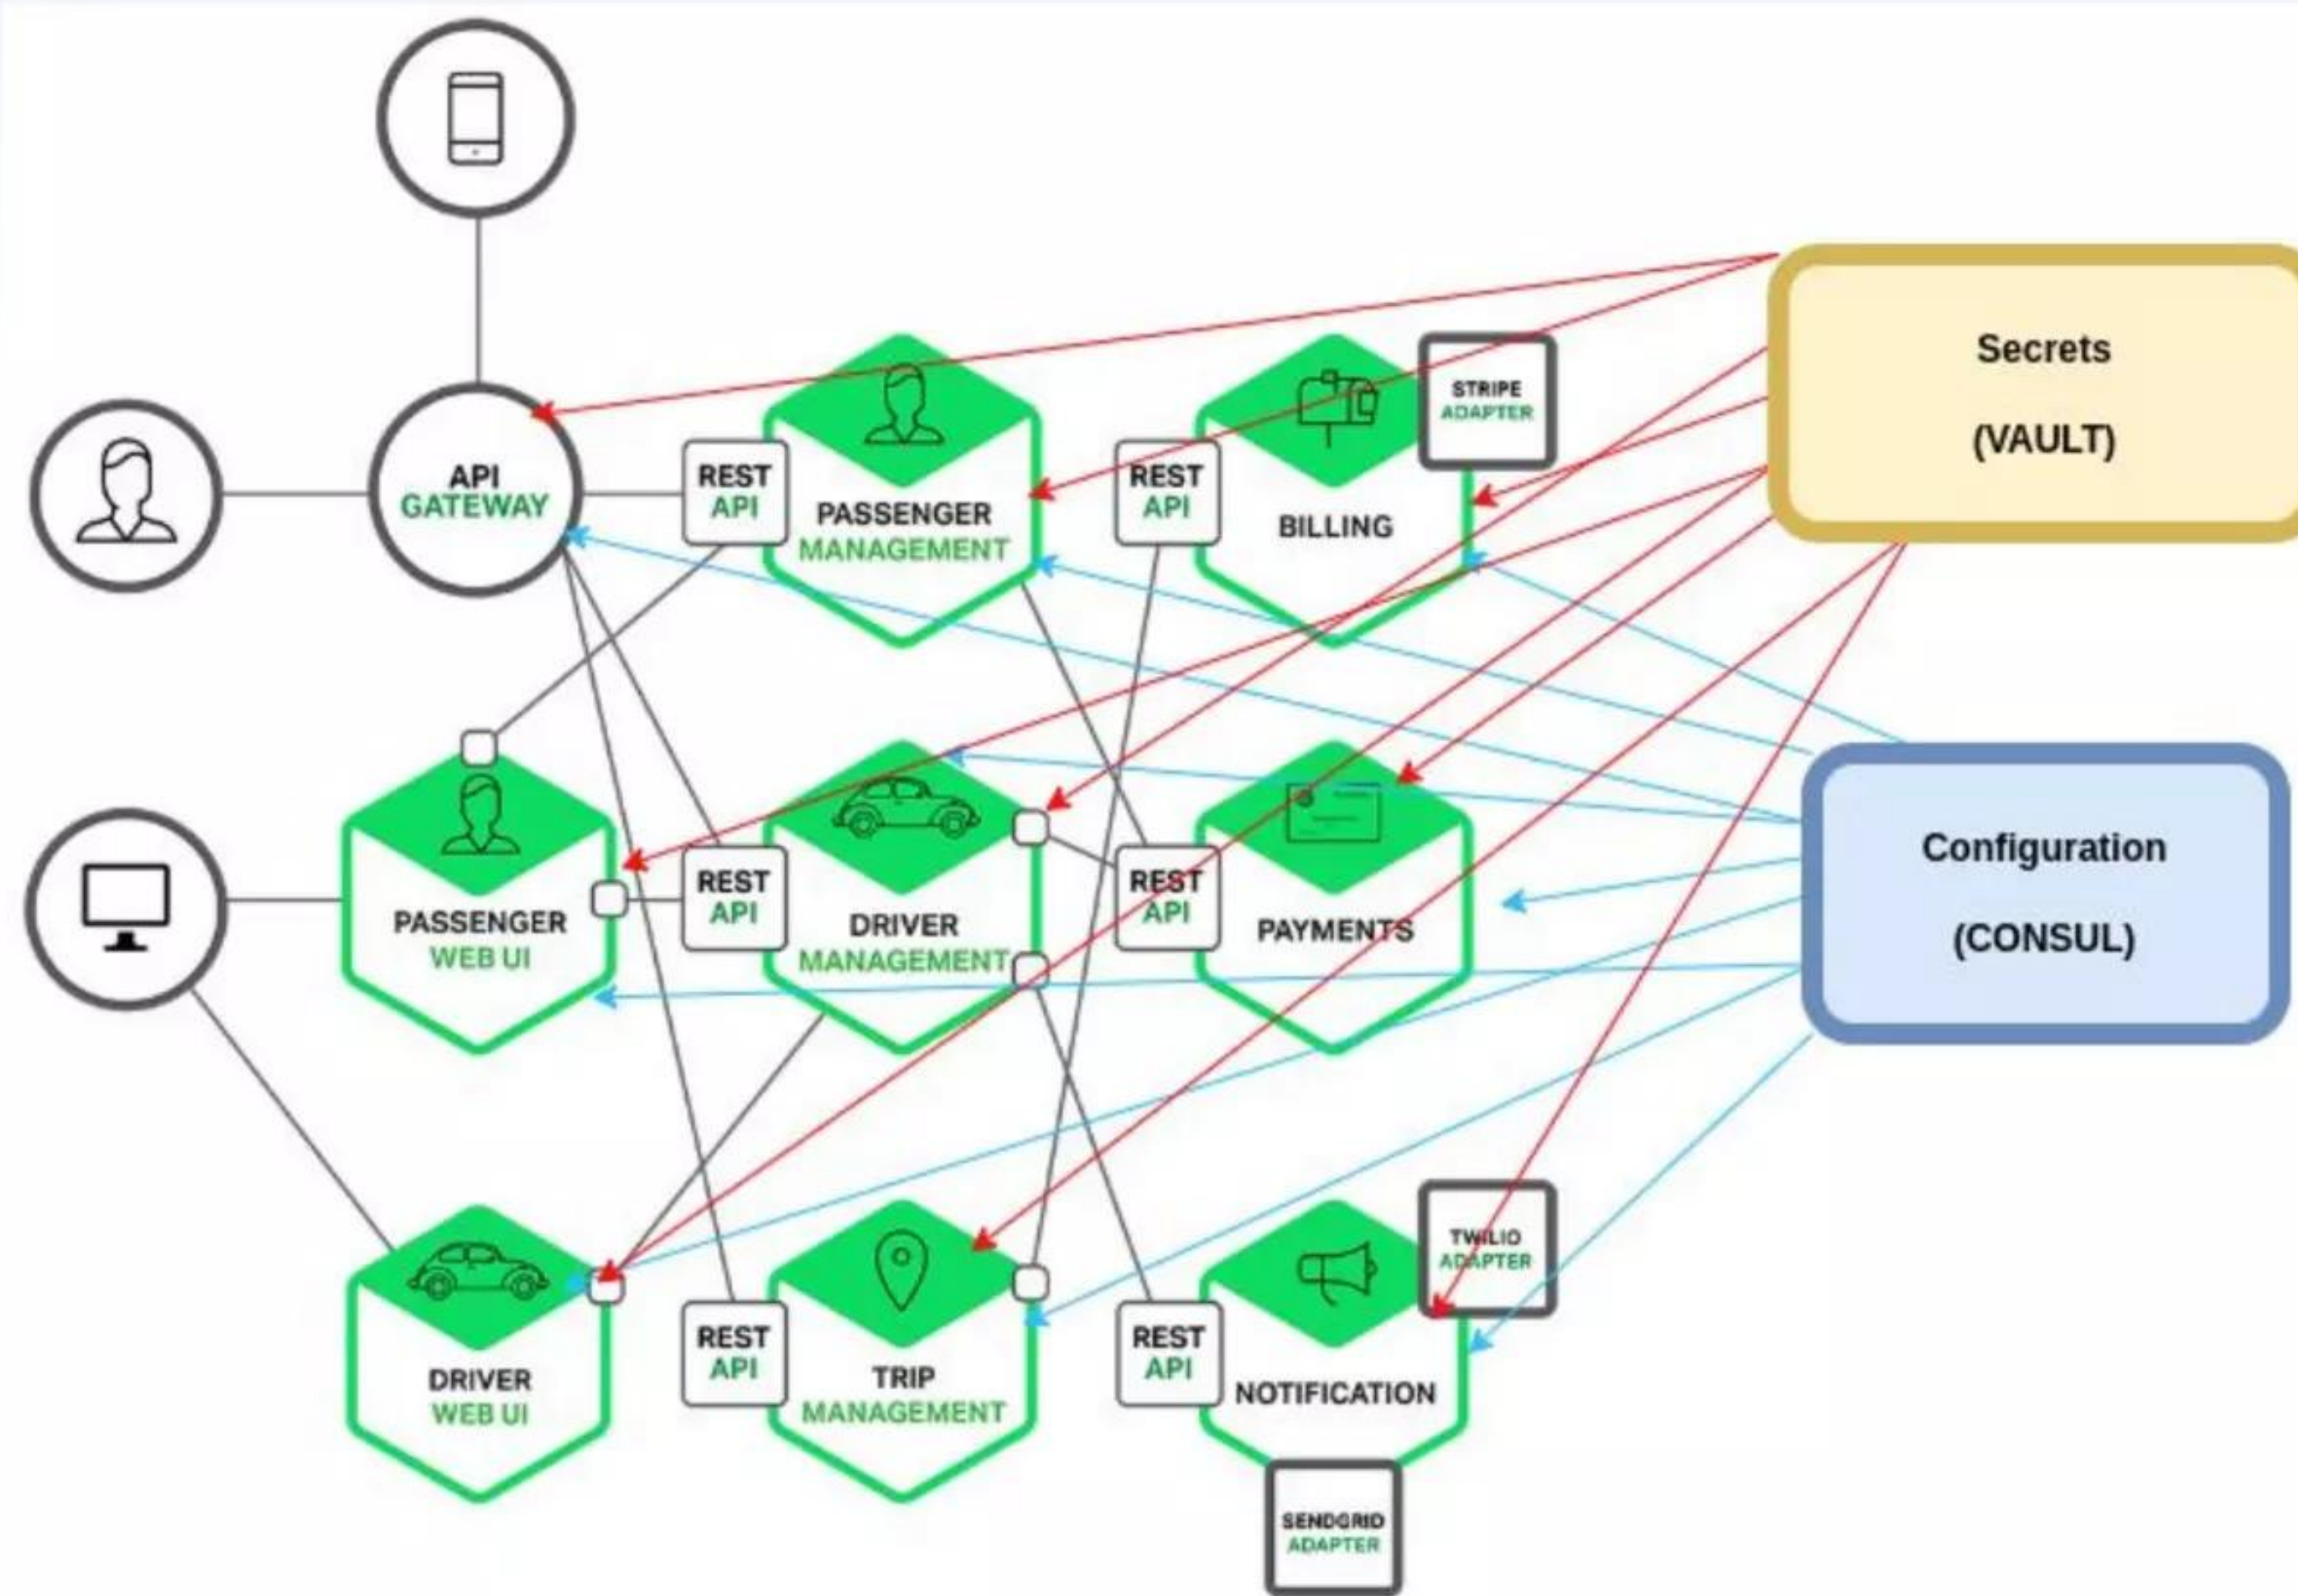

Event Driven (Data Logging)

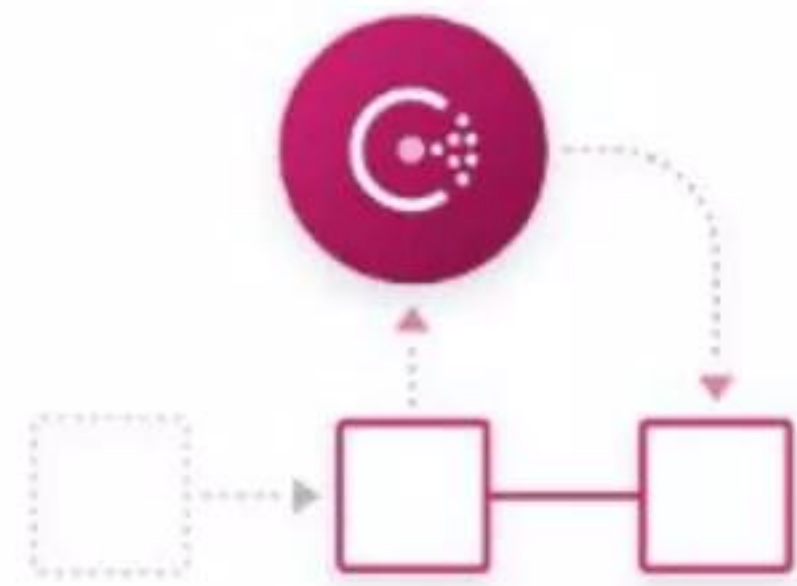

Sample App Architecture

Configuration

Configuration #2

Service Discovery

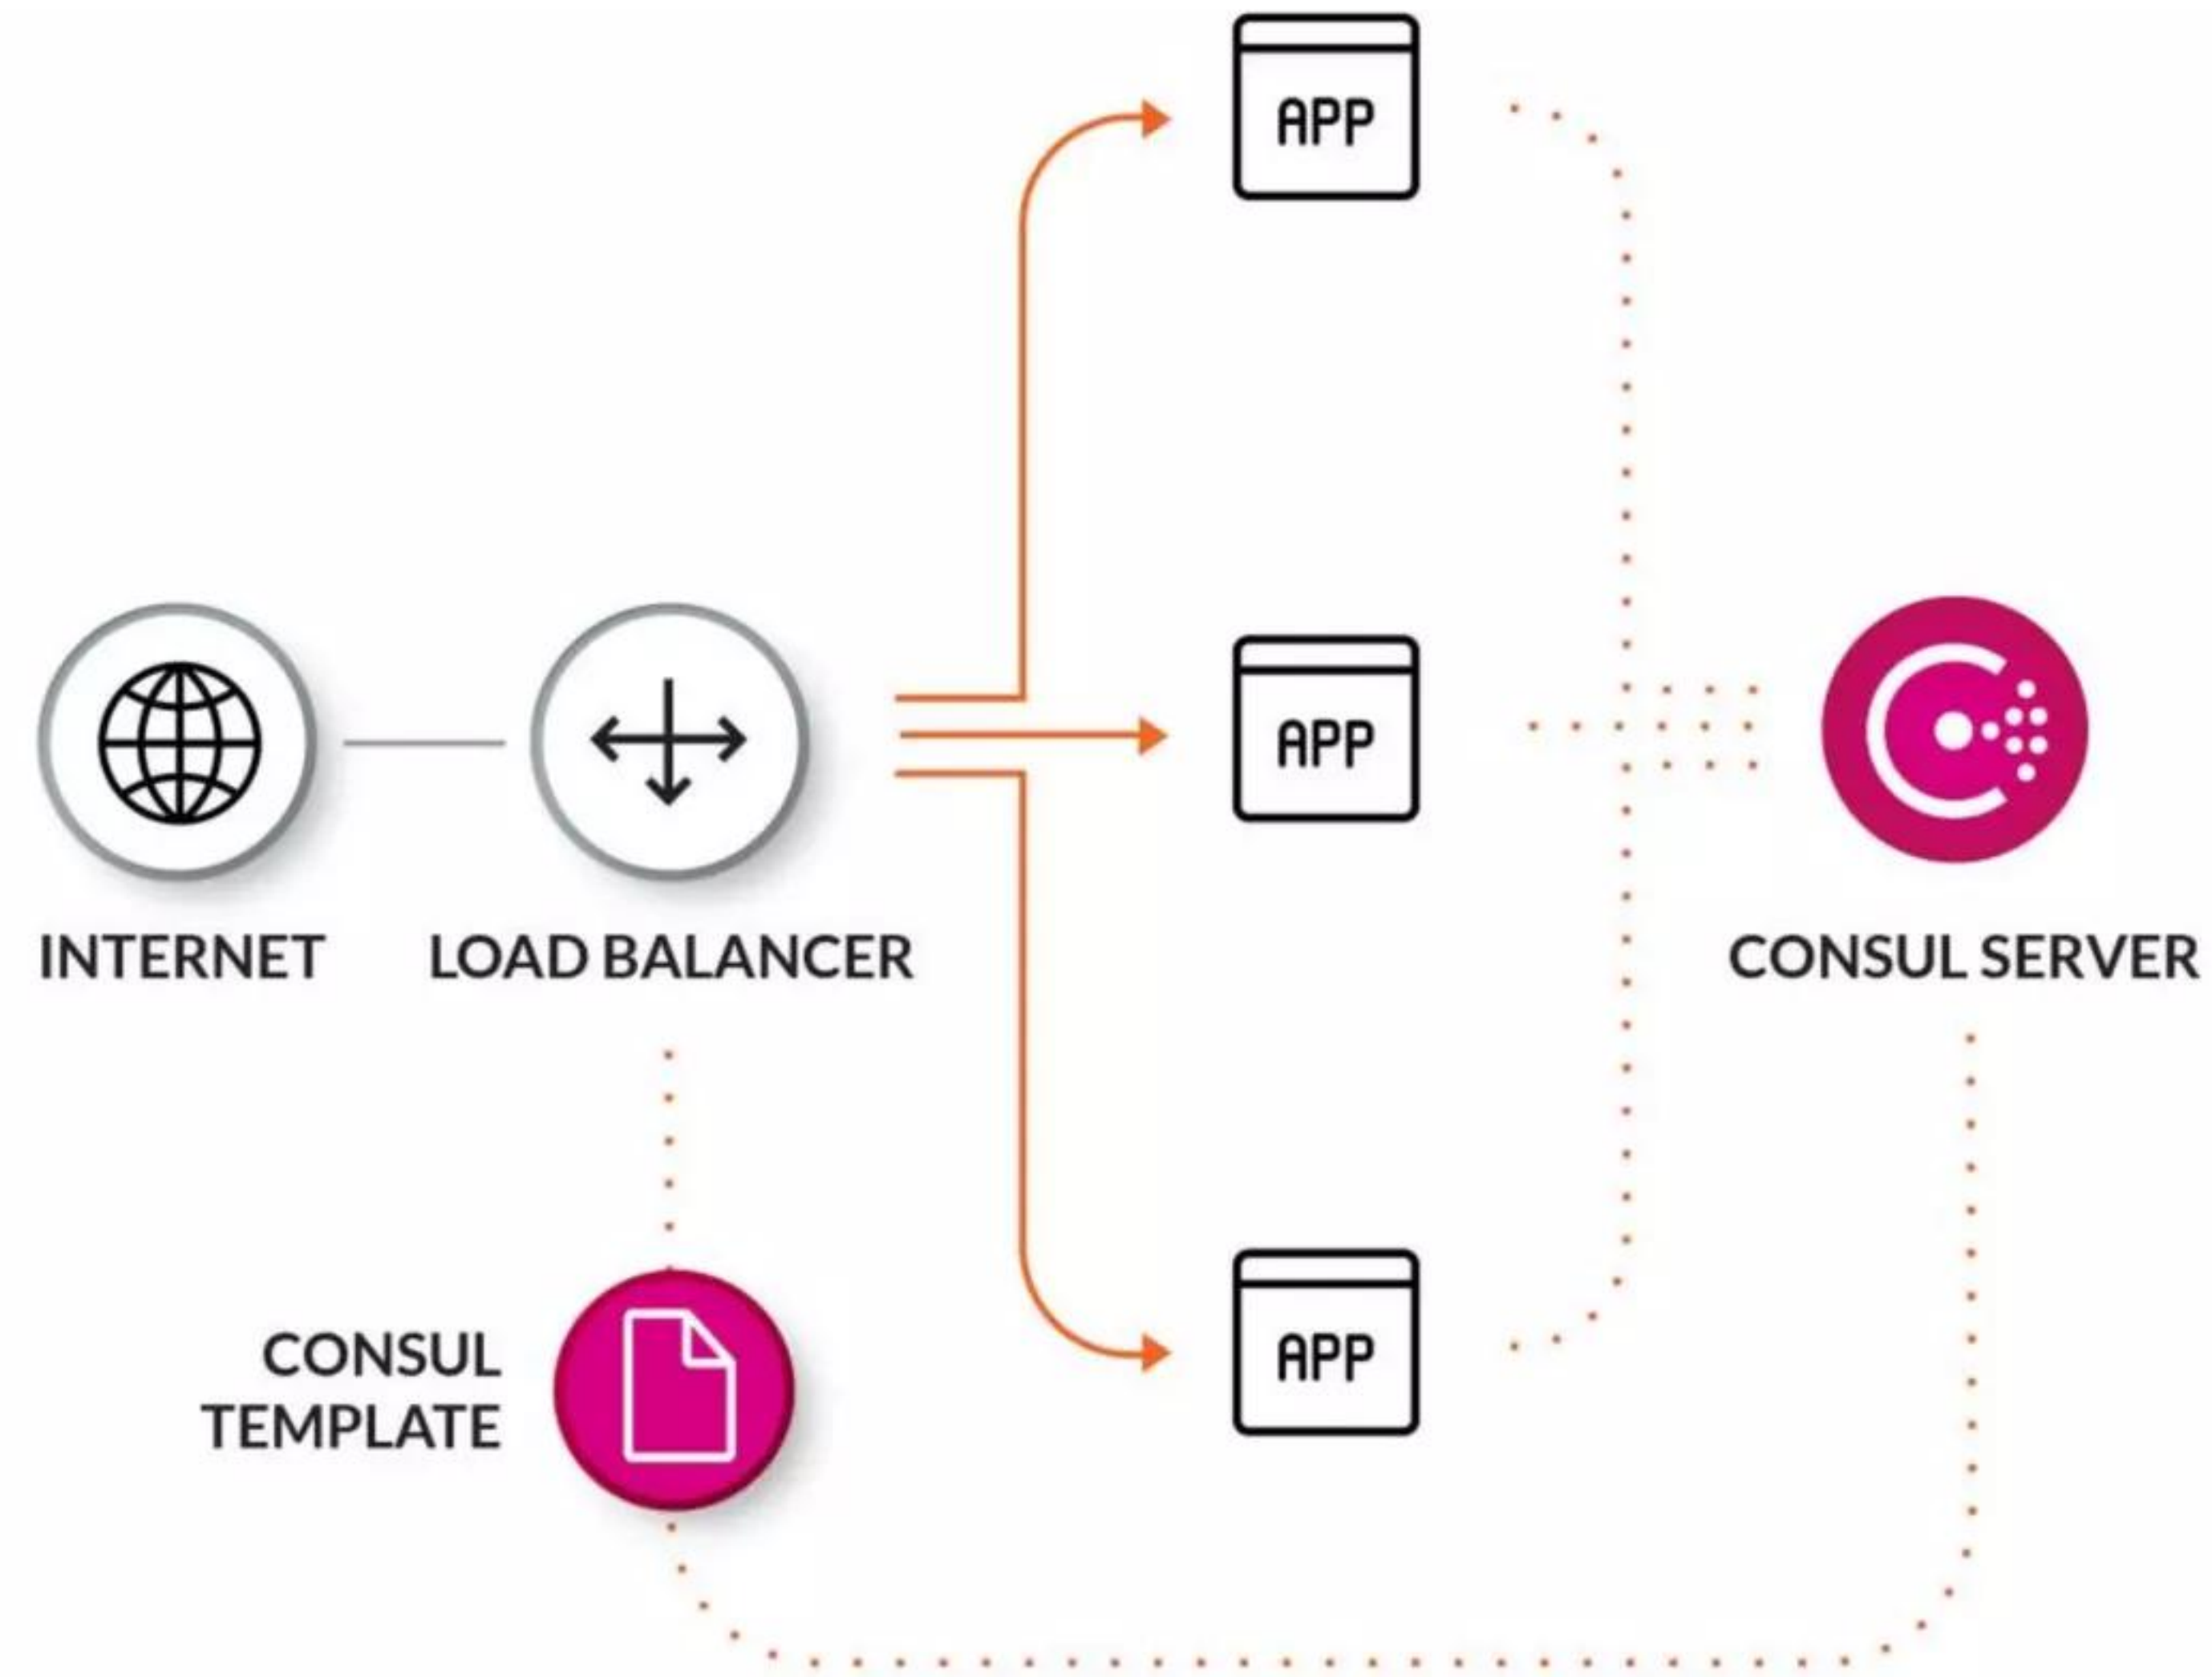

Service Configuration

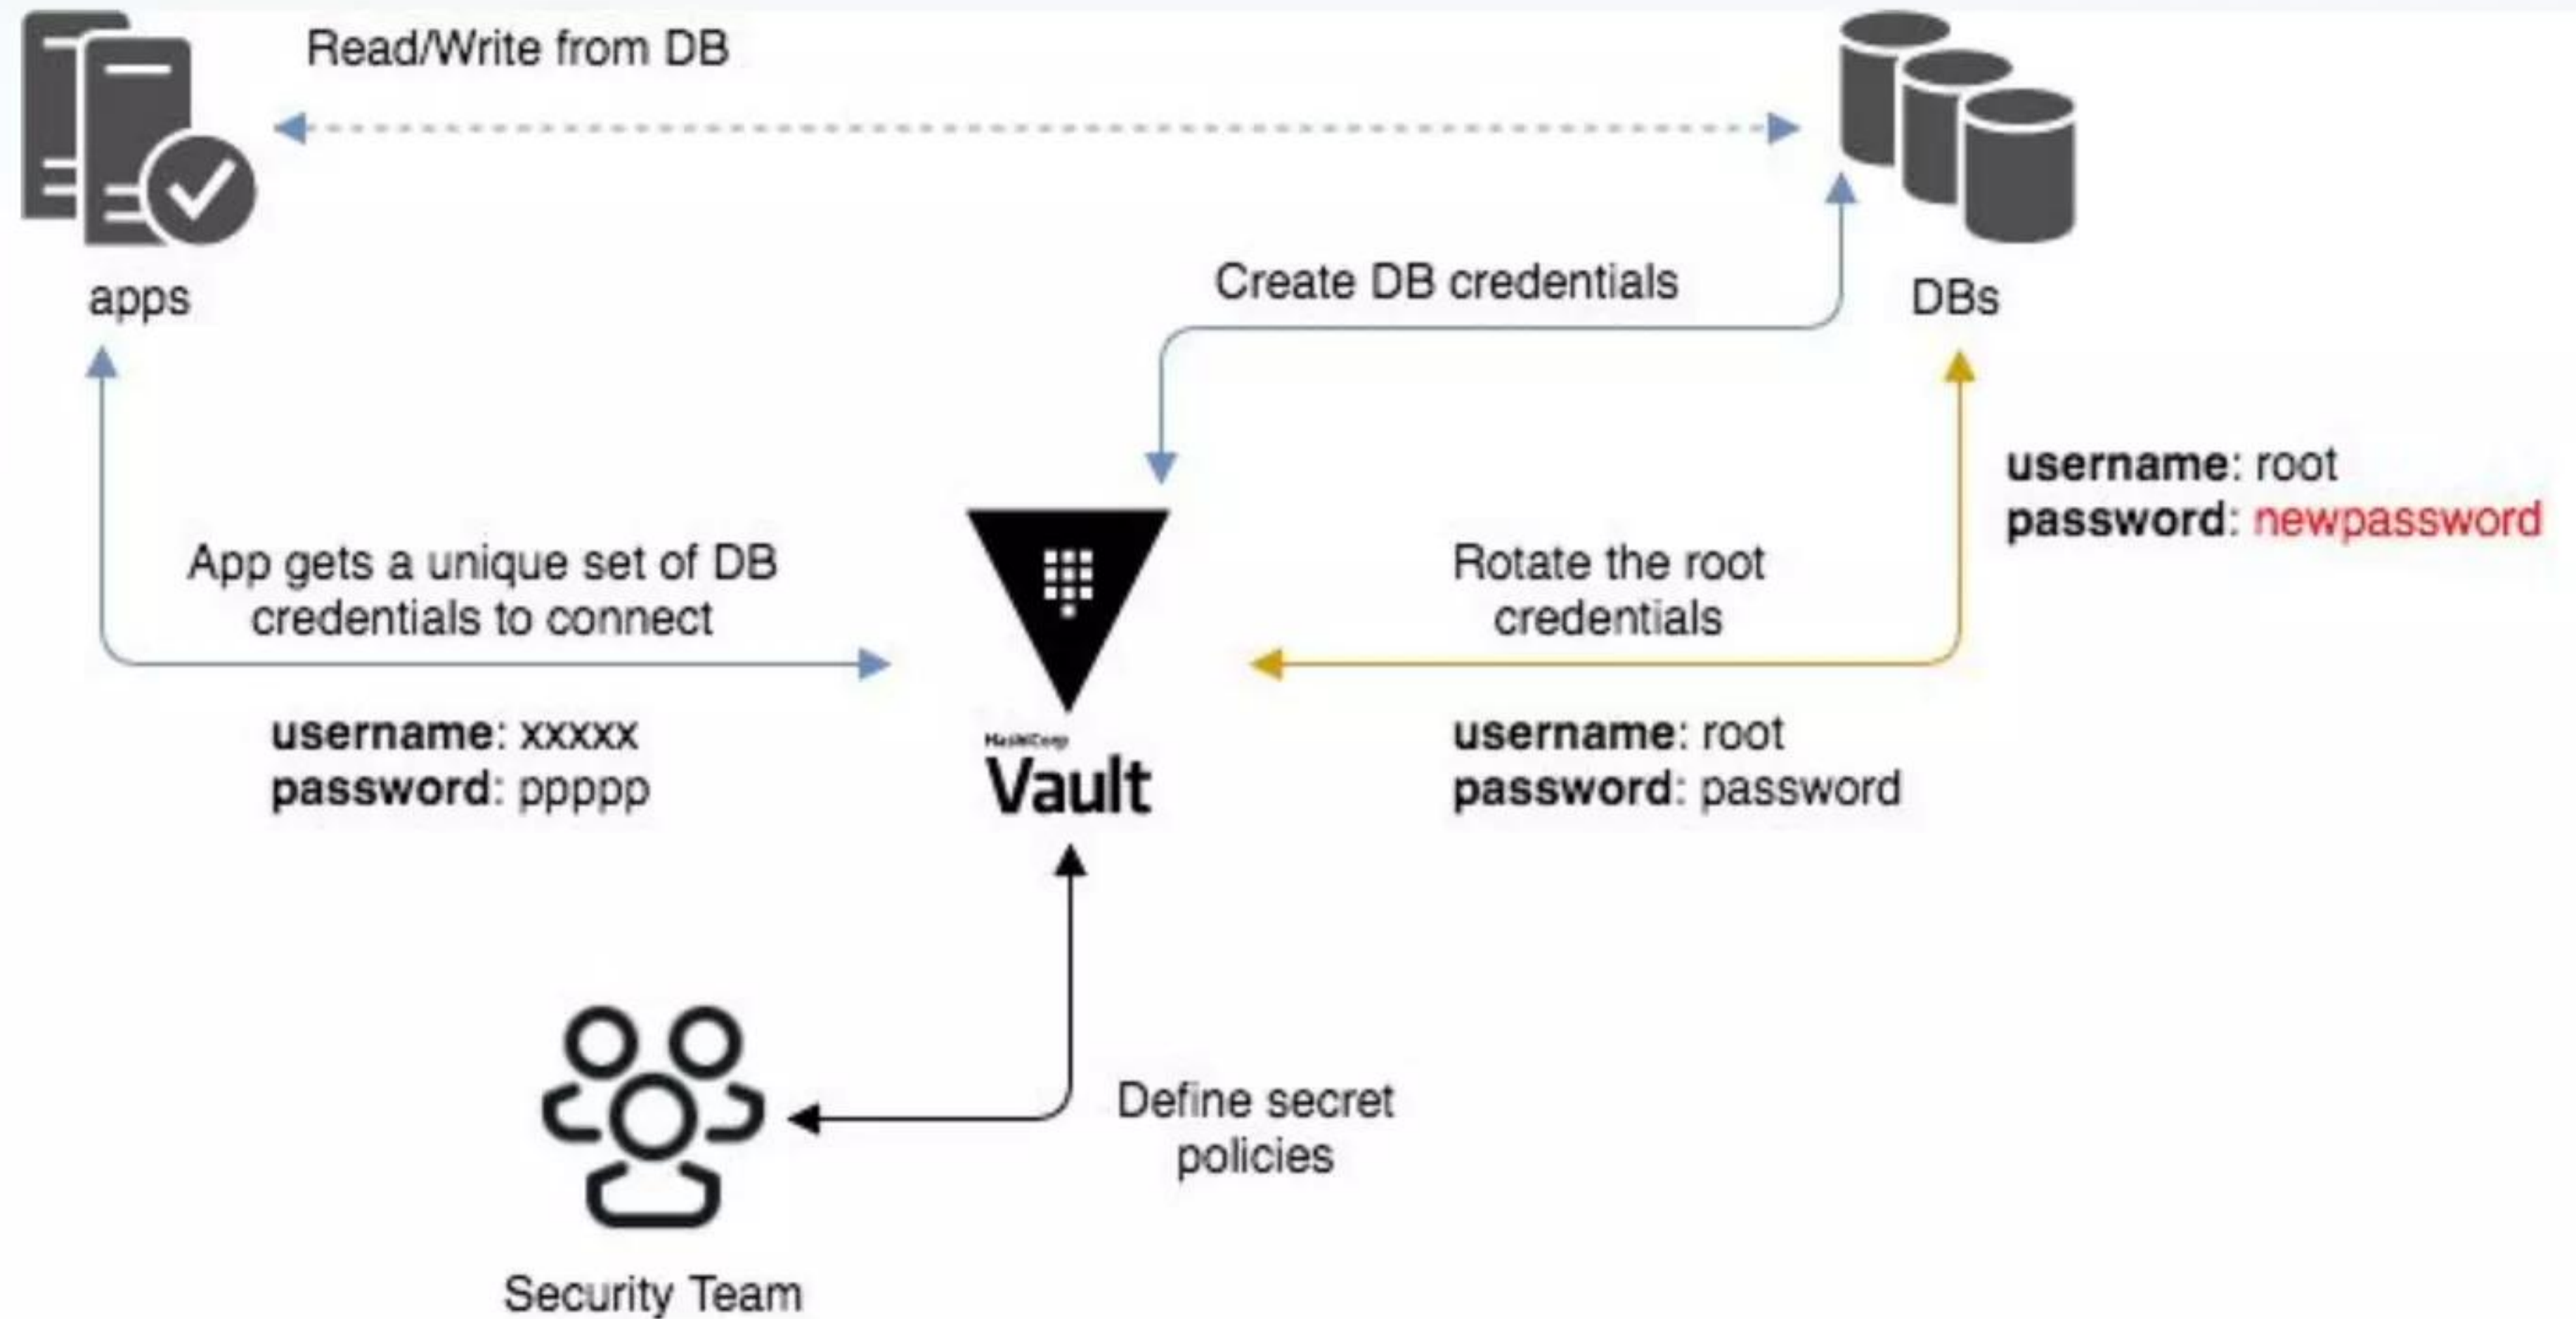

Service Segmentation

Configuration #3

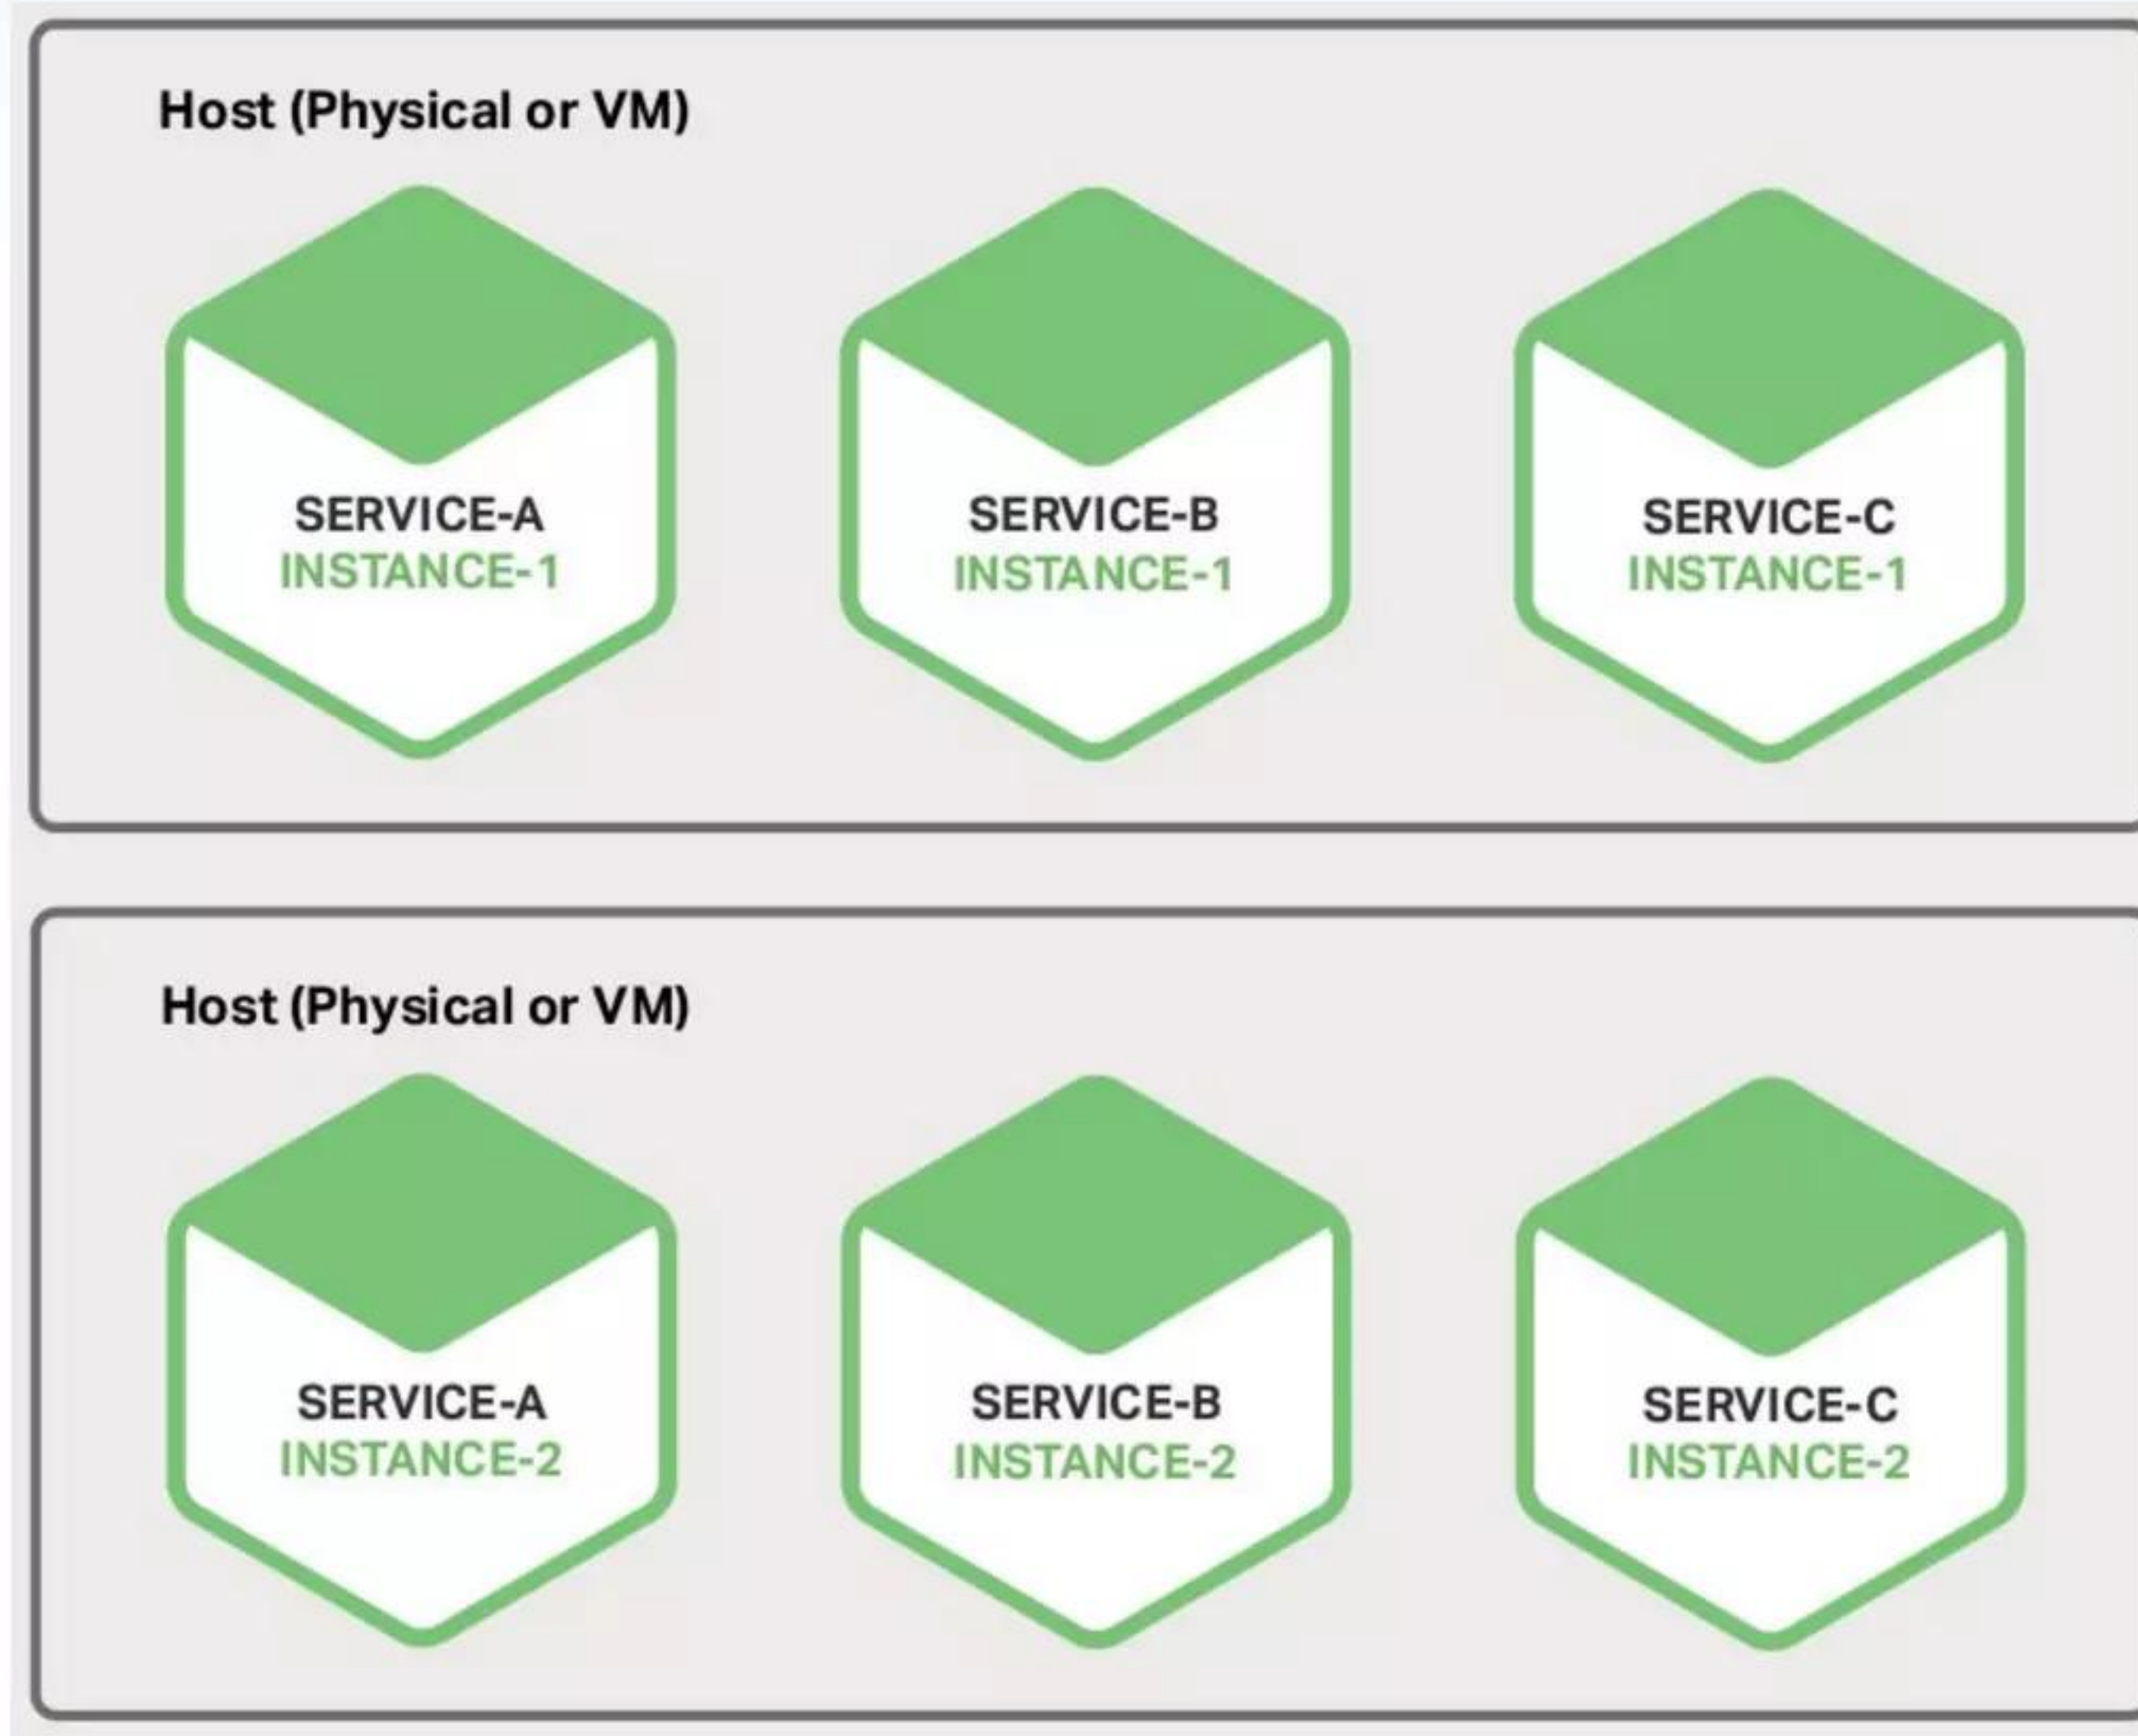

Secrets

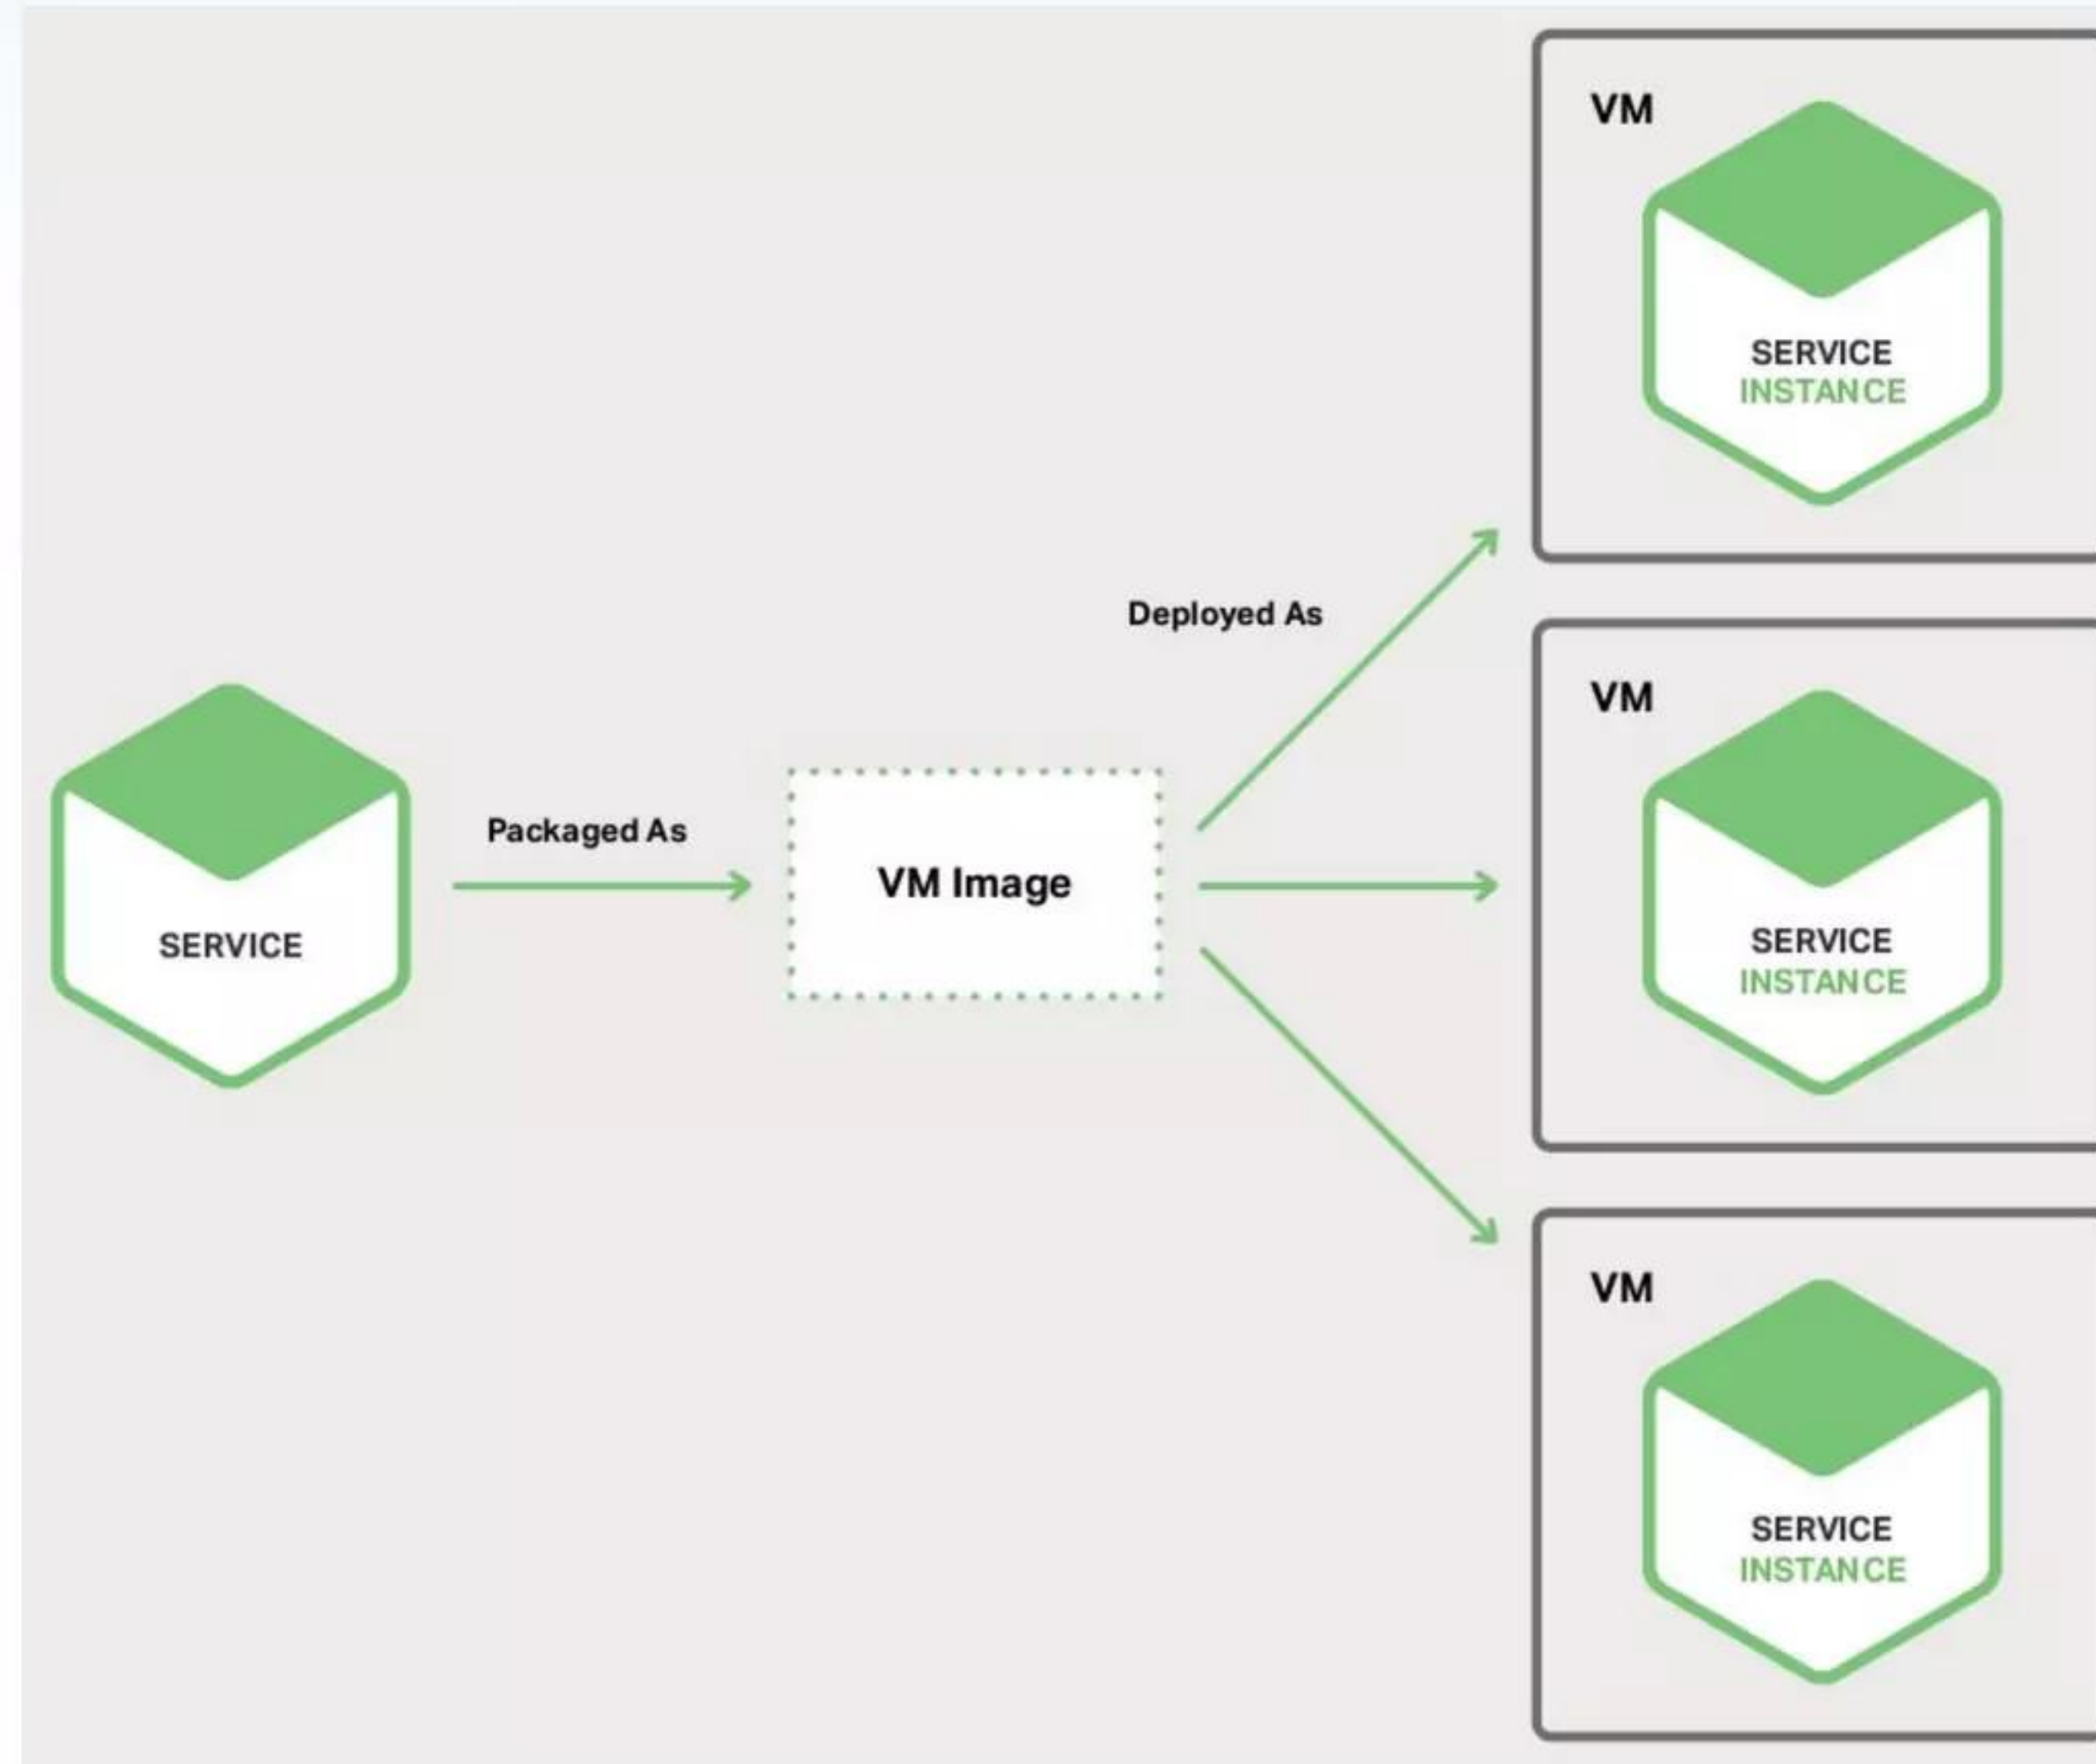

Deployment

- Classic : on top Bare metal server or VM
- Using Virtual machine for each instance (app node)
- Using Container and Container Orchestration

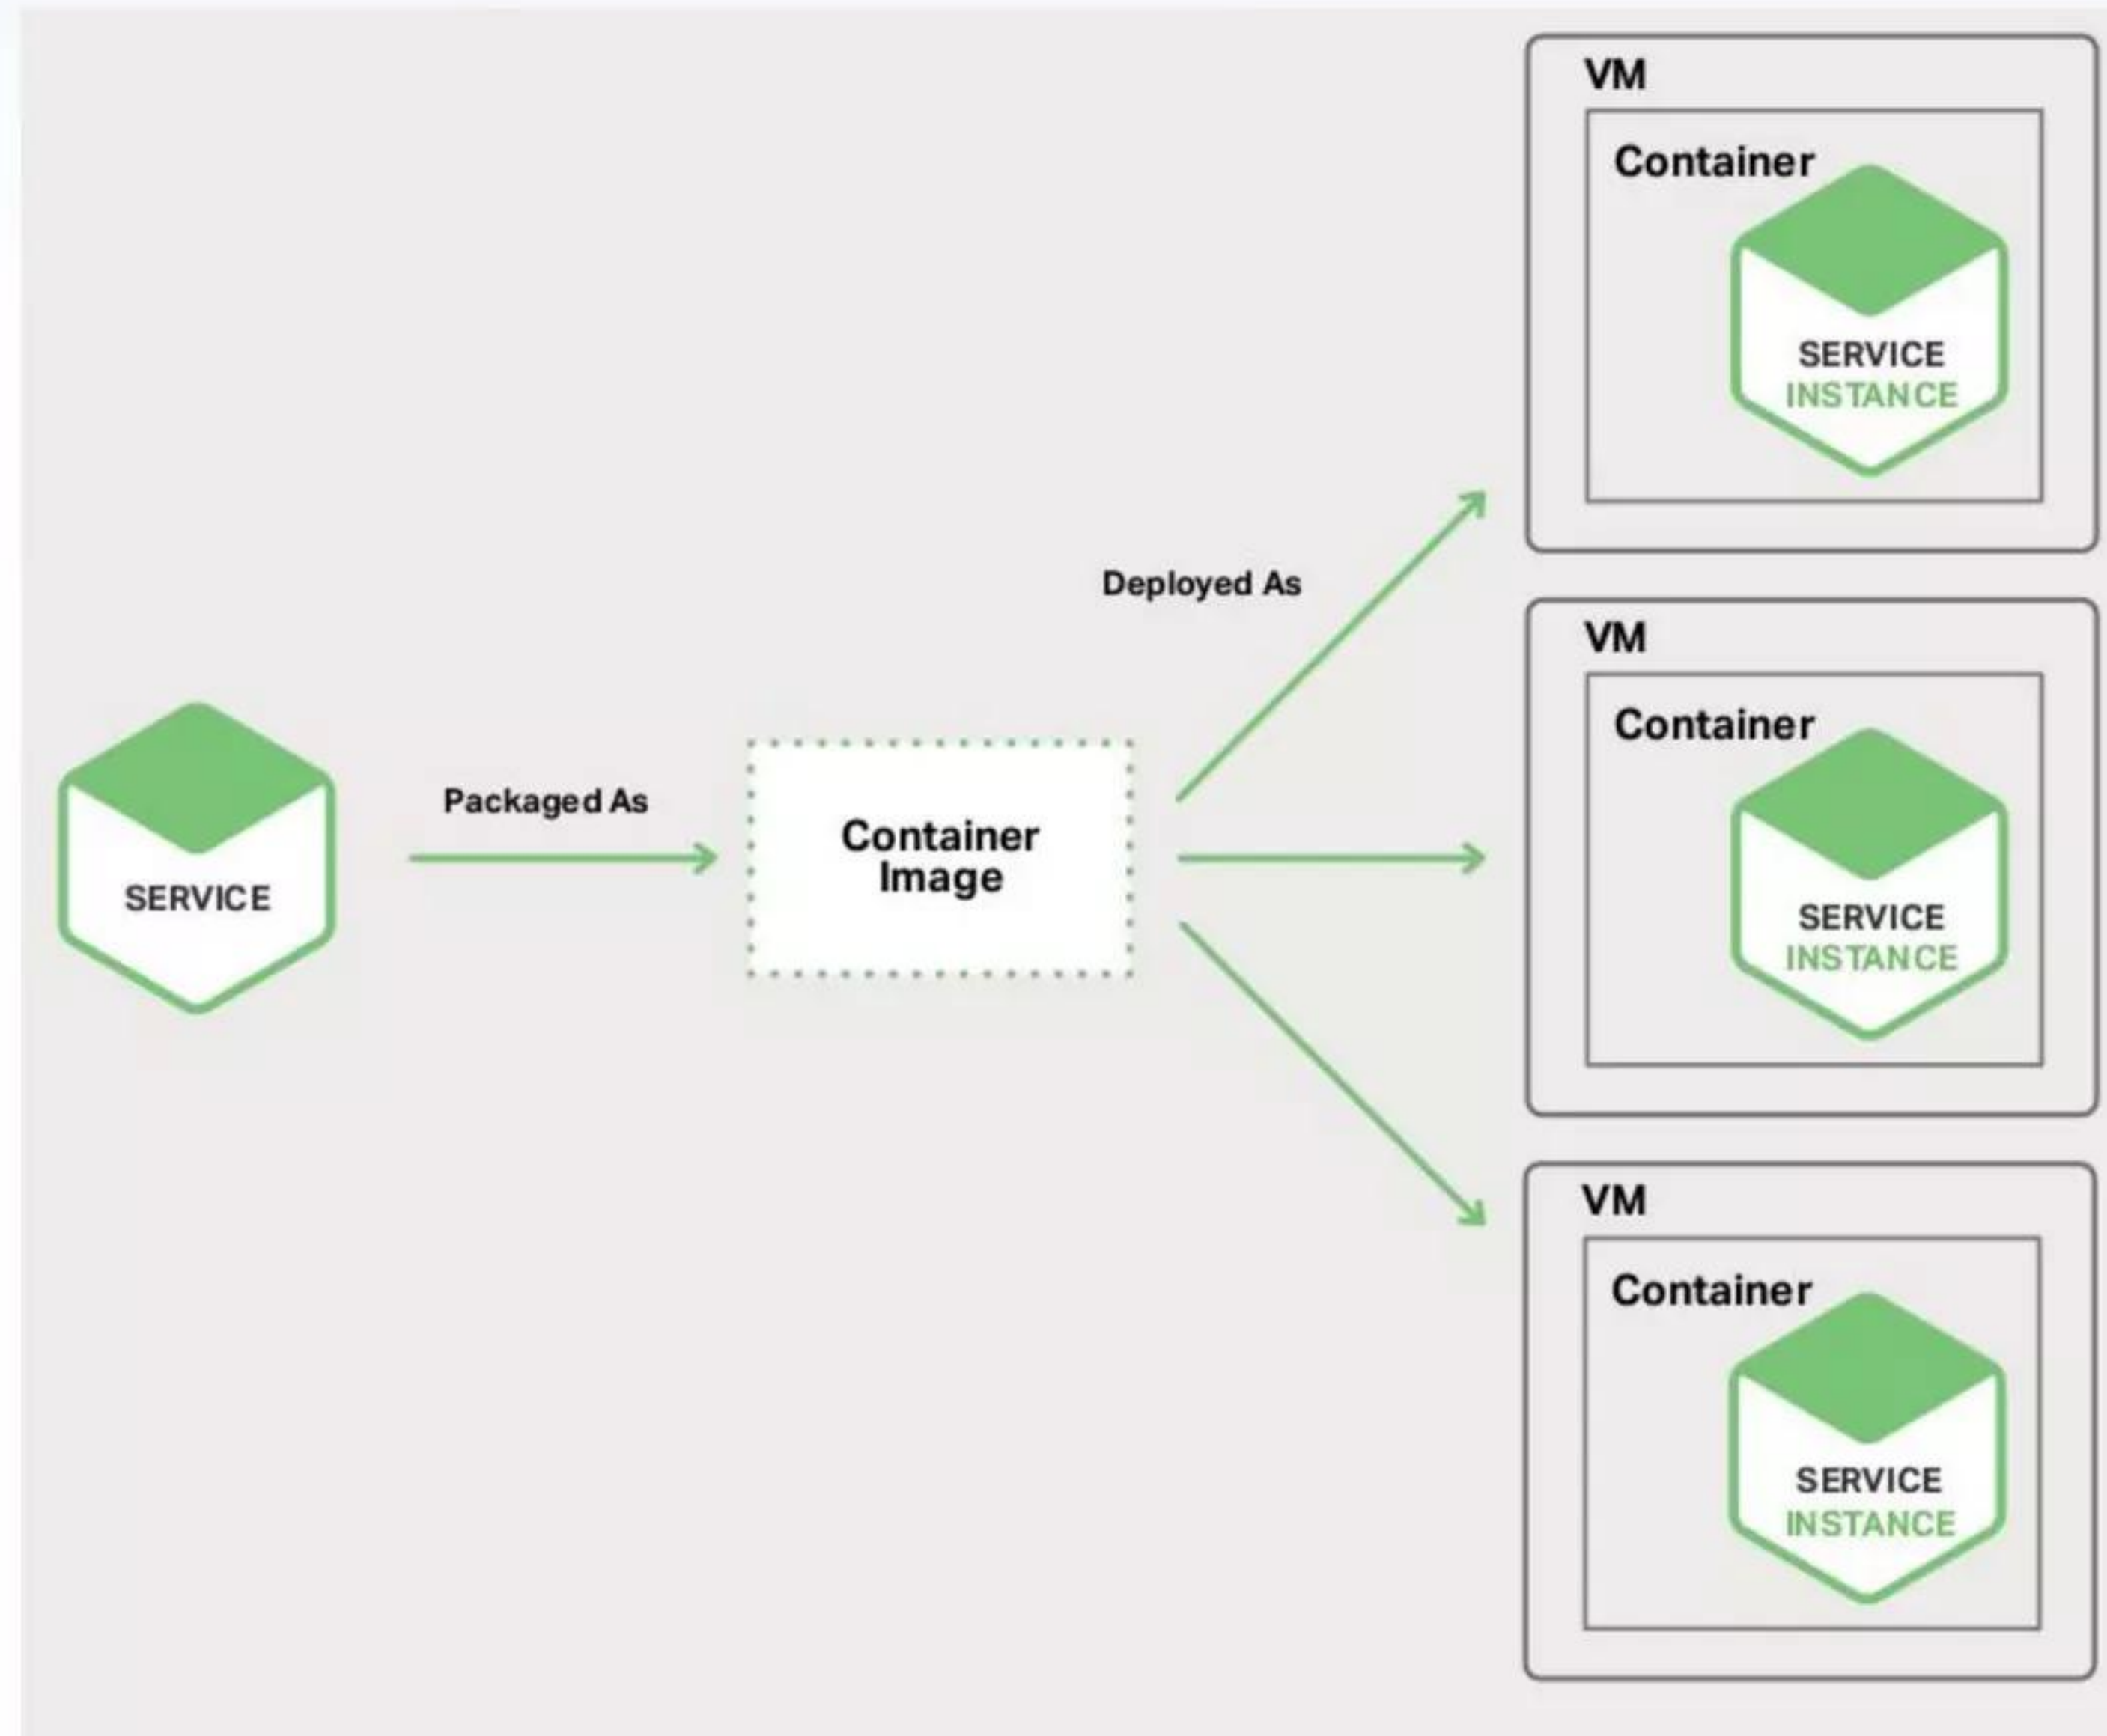

Deployment #1

Deployment #2

Deployment #3

DevOps

✓ DevOps is the **combination of cultural philosophies, practices, and tools** that increases an organization's ability to deliver applications and services at high velocity: evolving and improving products at a faster pace than organizations using traditional software development and infrastructure management processes.

DevSecOps

Now, in the collaborative framework of DevOps, security is a shared responsibility integrated from end to end.

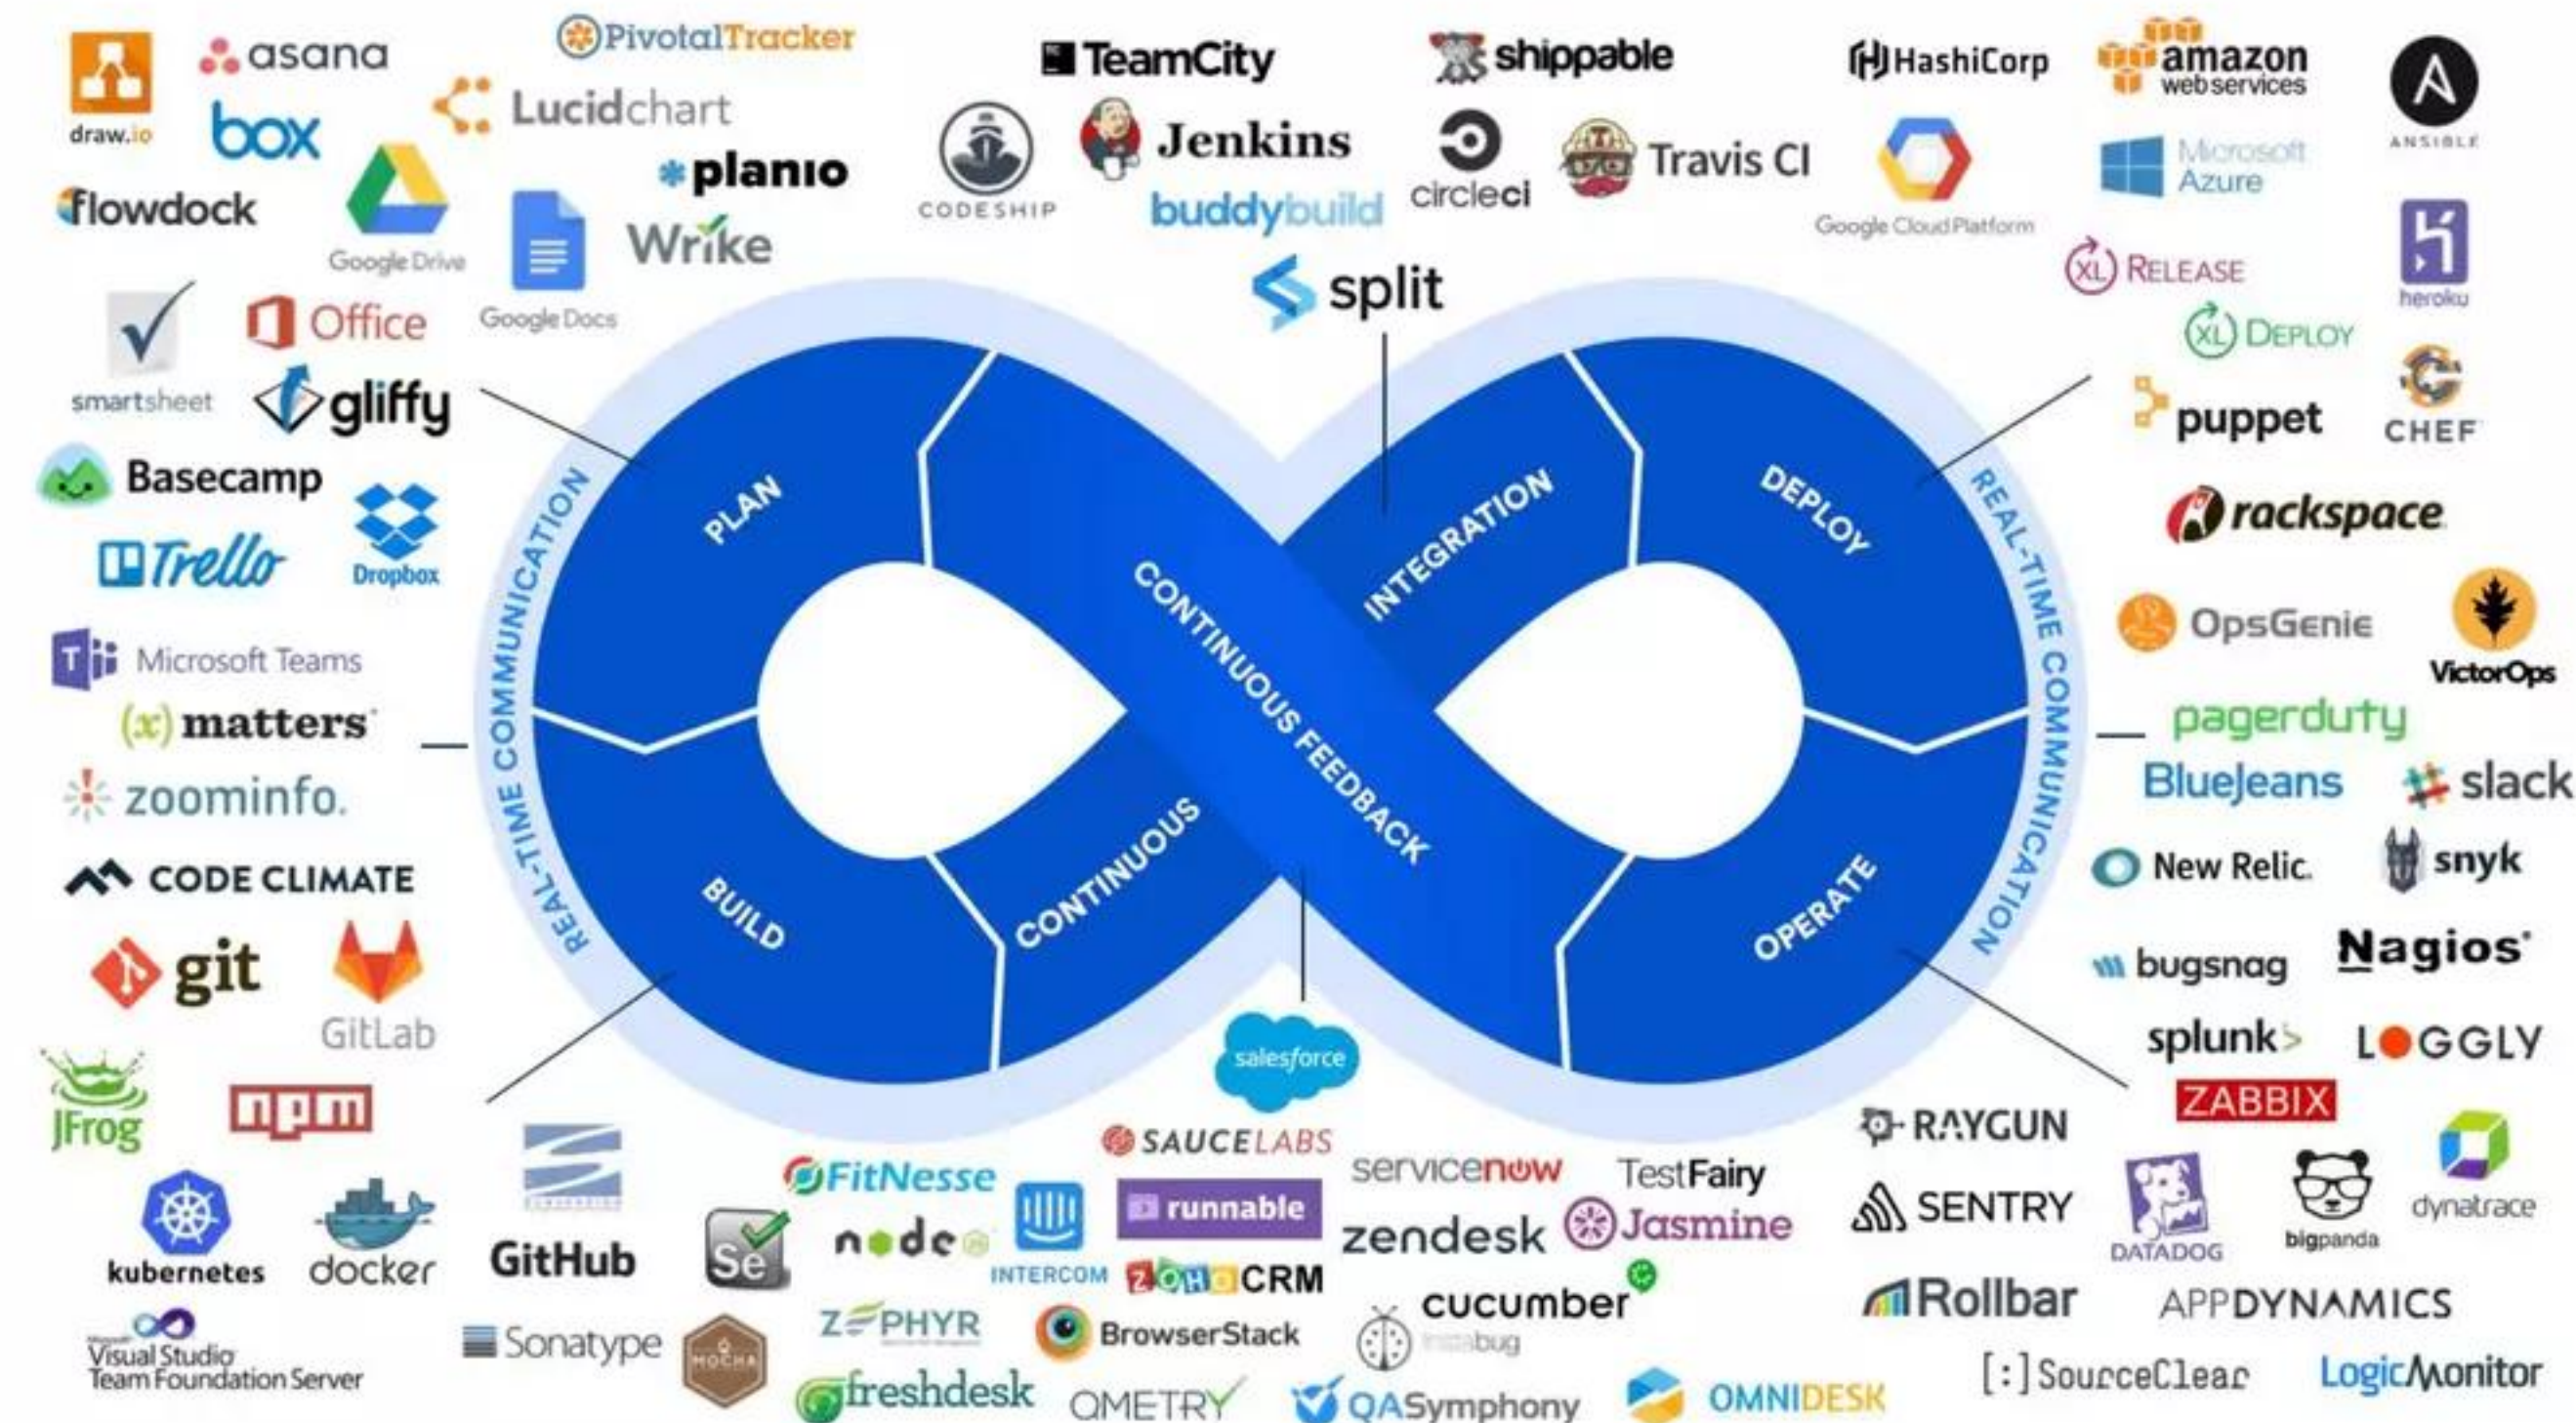

The term "DevSecOps" to emphasize the need to build a security foundation into DevOps initiatives.

It also means automating some security gates to keep the DevOps workflow from slowing down.

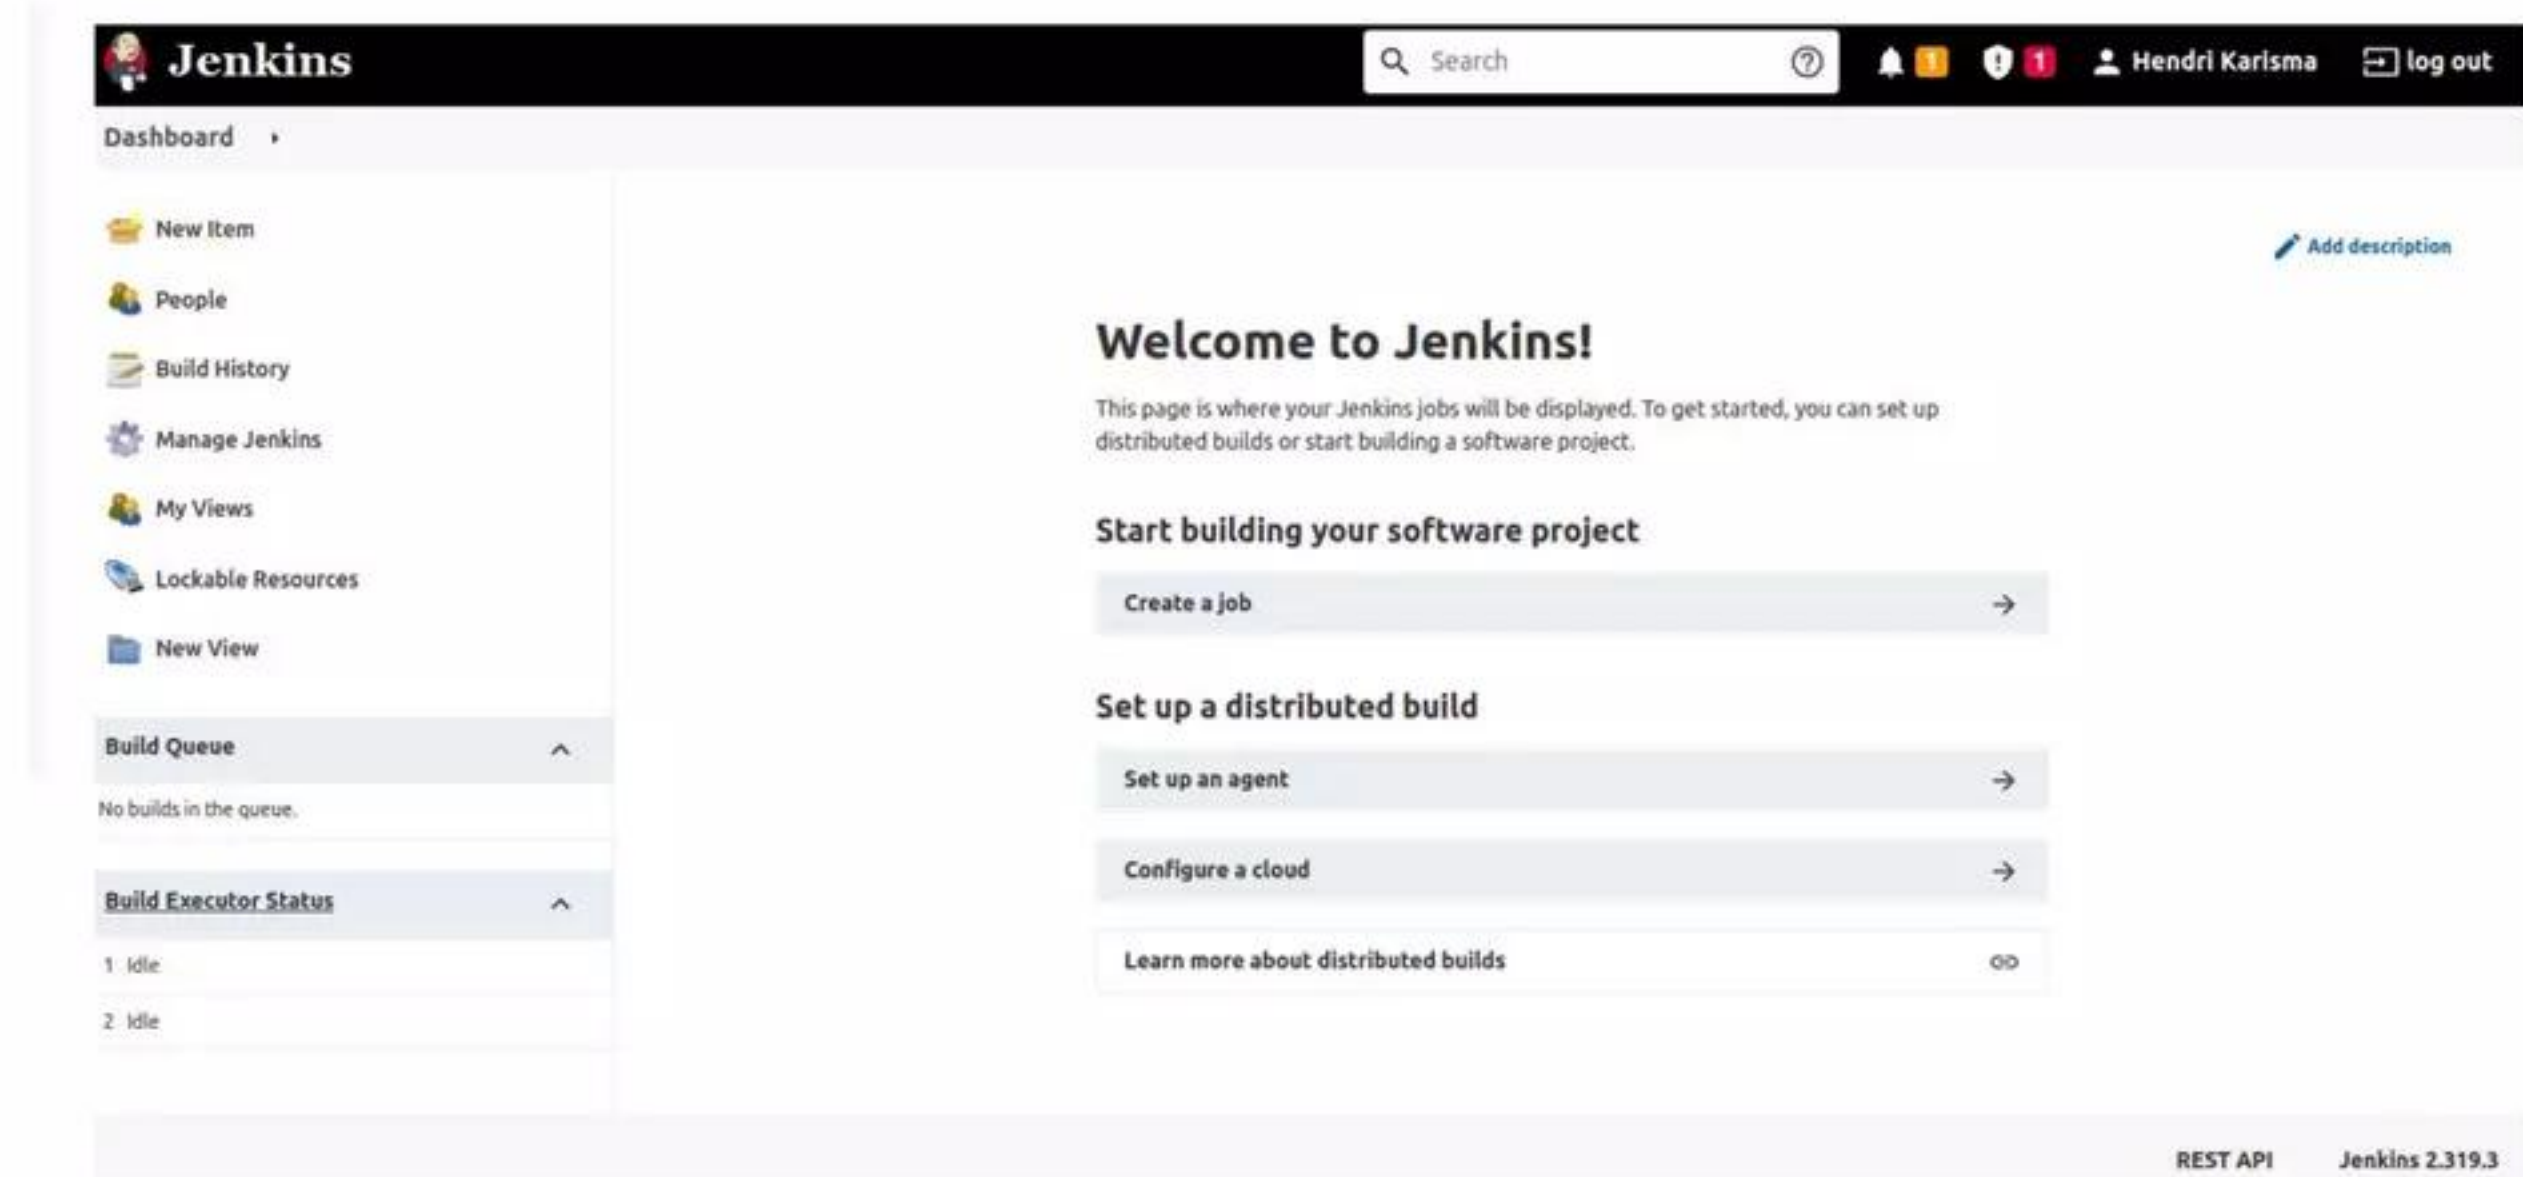

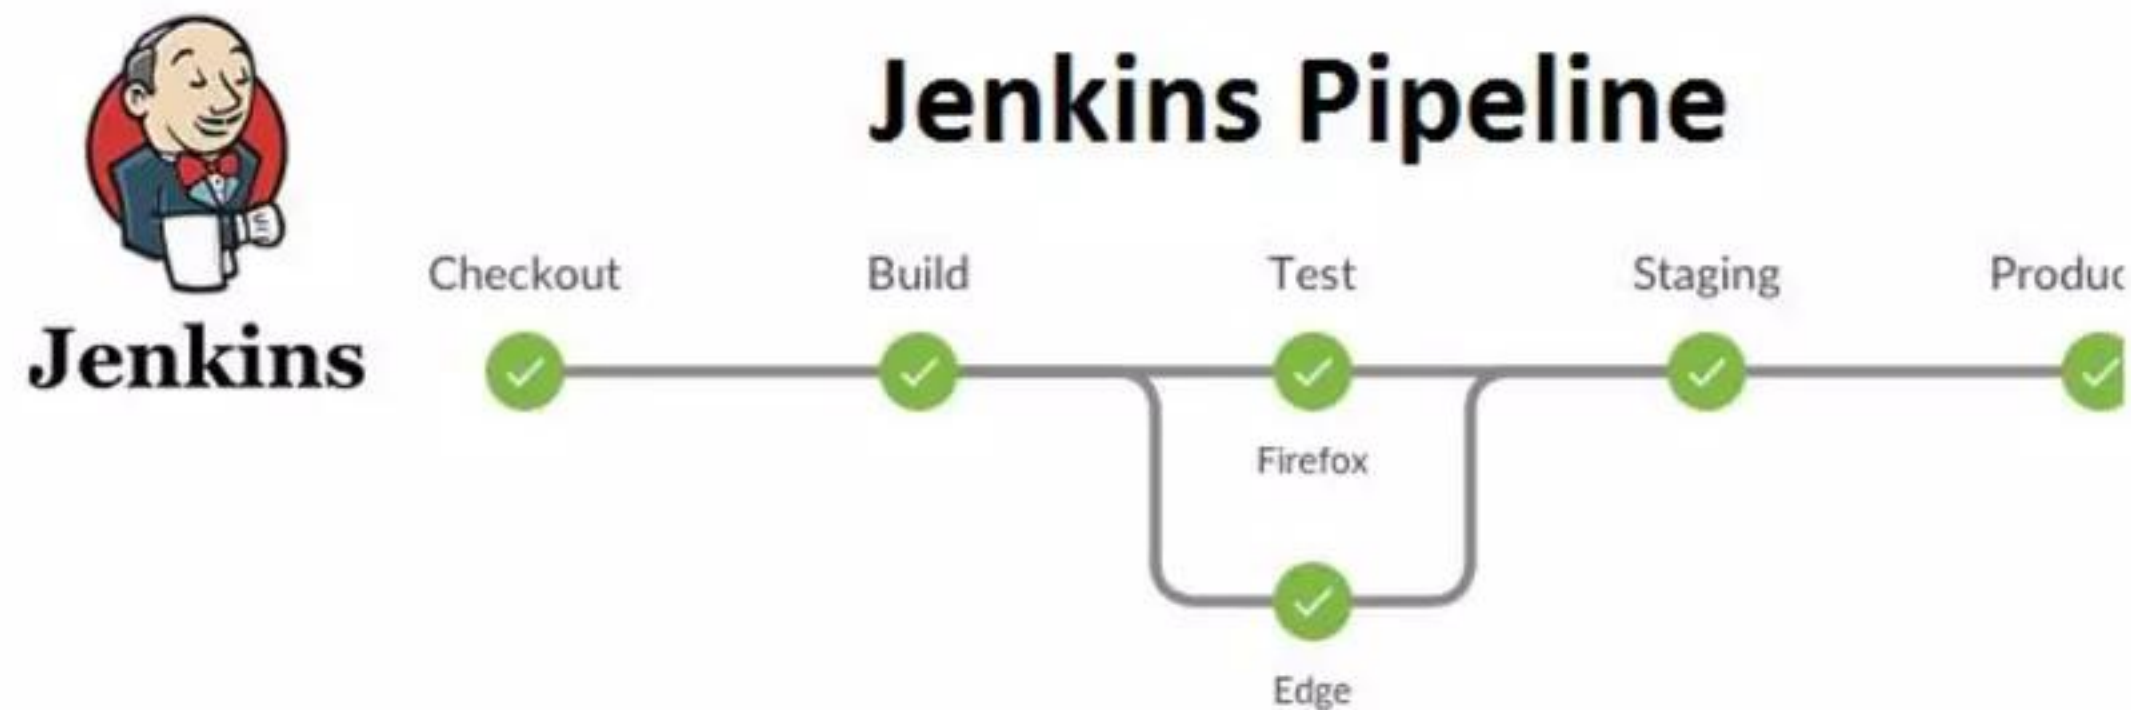

Tech to Support DevSecOps

- Automation Server: Jenkins, Bamboo, Github Action, travis, circleci, ansible, etc
- Infrastructure as code / CLI: AWS SDK, GCP SDK, terraform, chef, etc
- Registry/Repository : docker hub, helm, GCR, etc
- Security scanner : Sonarqube, trivy, etc
- Container Orchestration: Kubernetes, Docker swarm
- Configuration & Secret : vault & consul
- Code Repository: bitbucket, github, gitlab, etc

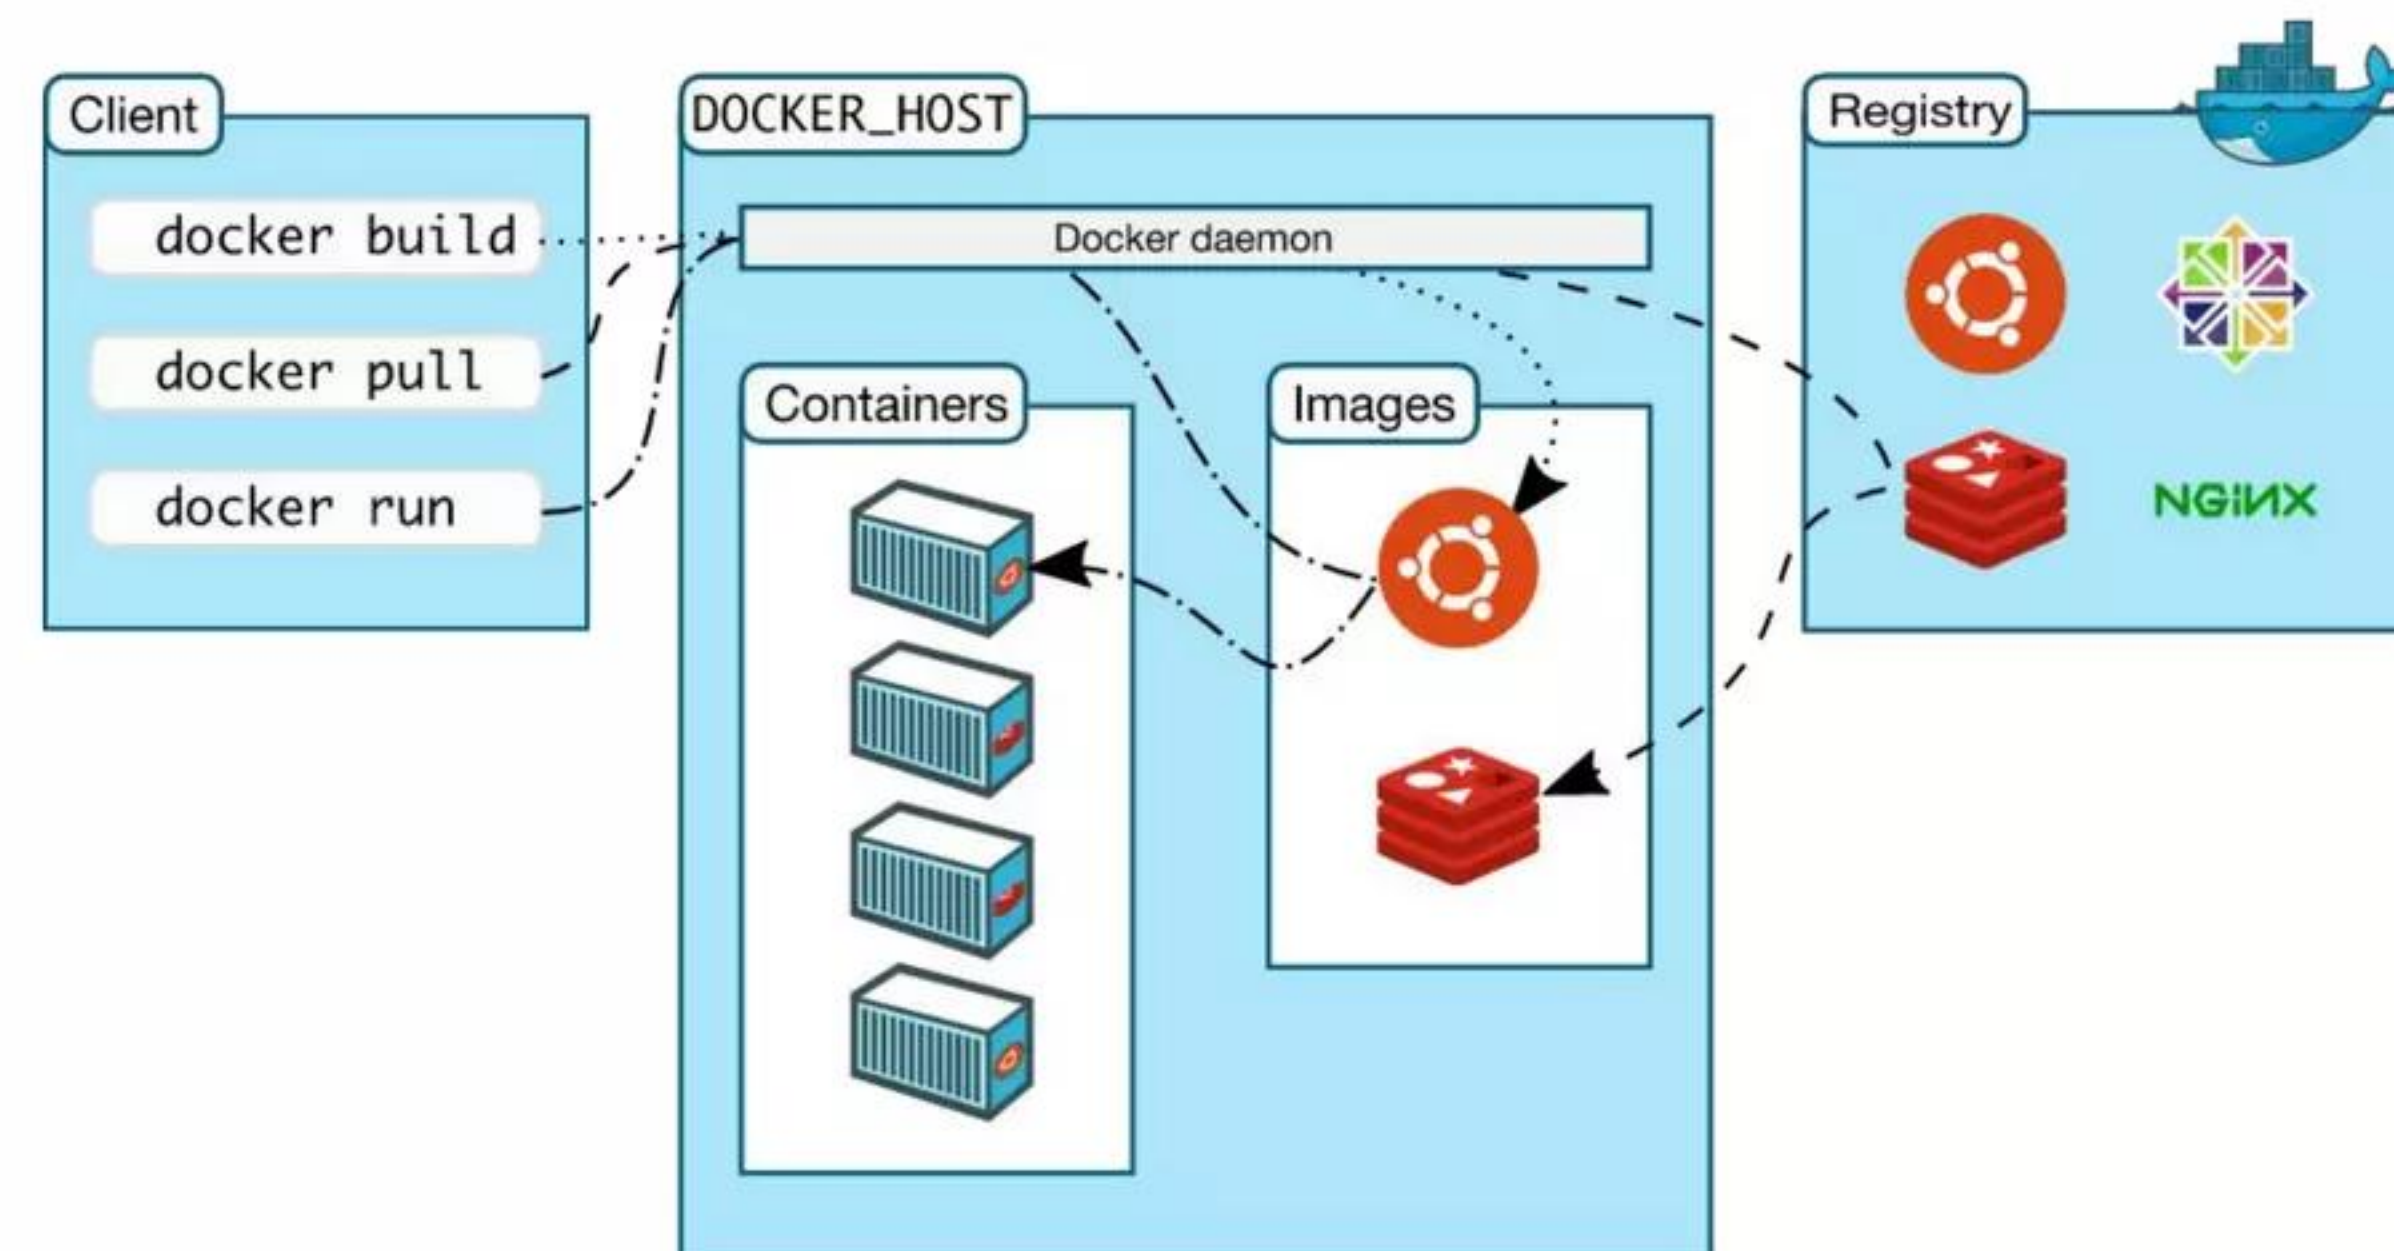

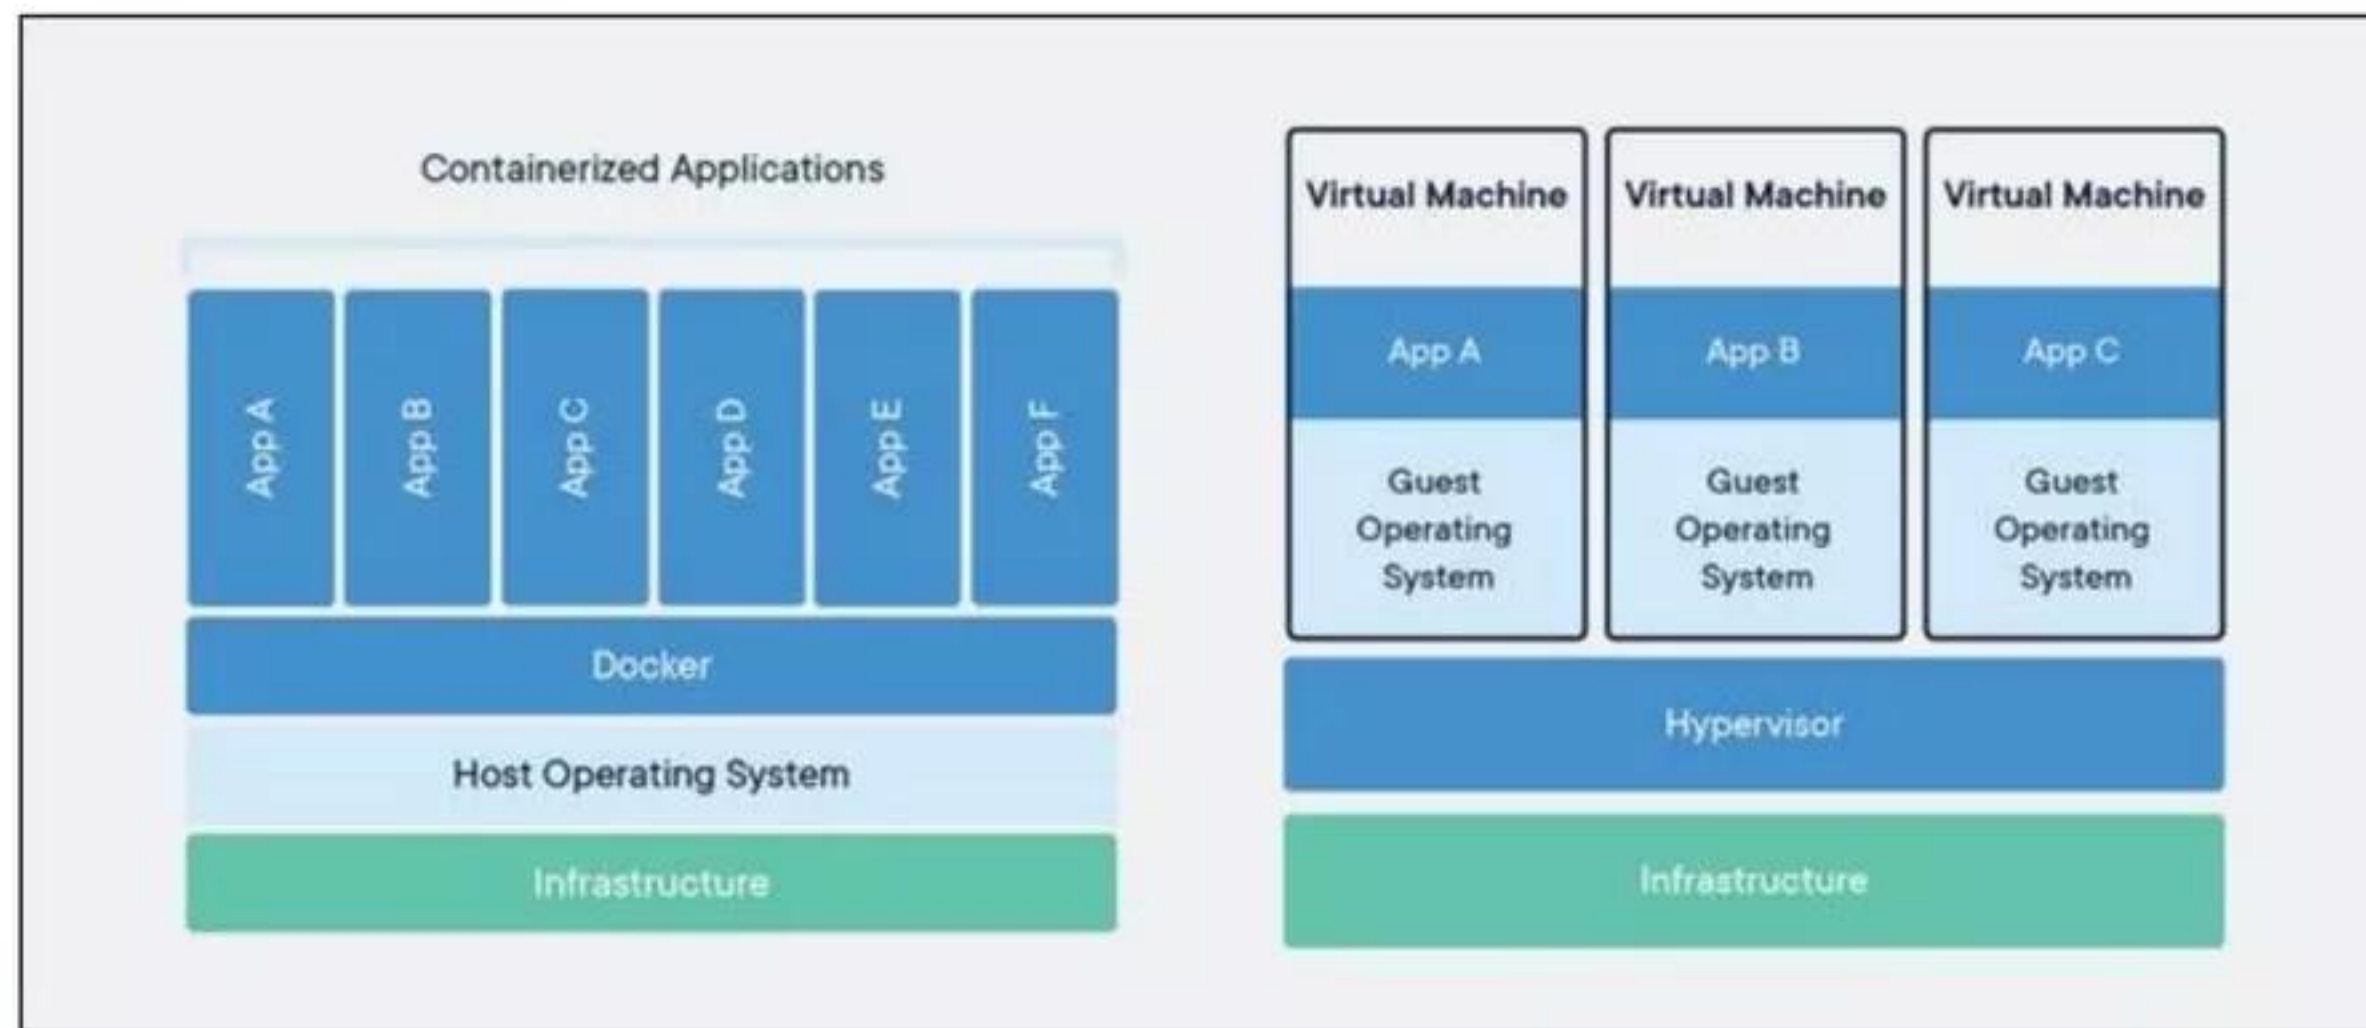

Jenkins

An open source extensible automation server. It helps automate the parts of software development related to building, testing, and deploying, facilitating continuous integration and continuous delivery.

Docker

an open source containerization platform. It **enables developers to package applications into containers**—standardized executable components combining application source code with the operating system (OS) libraries and dependencies required to run that code in any environment.

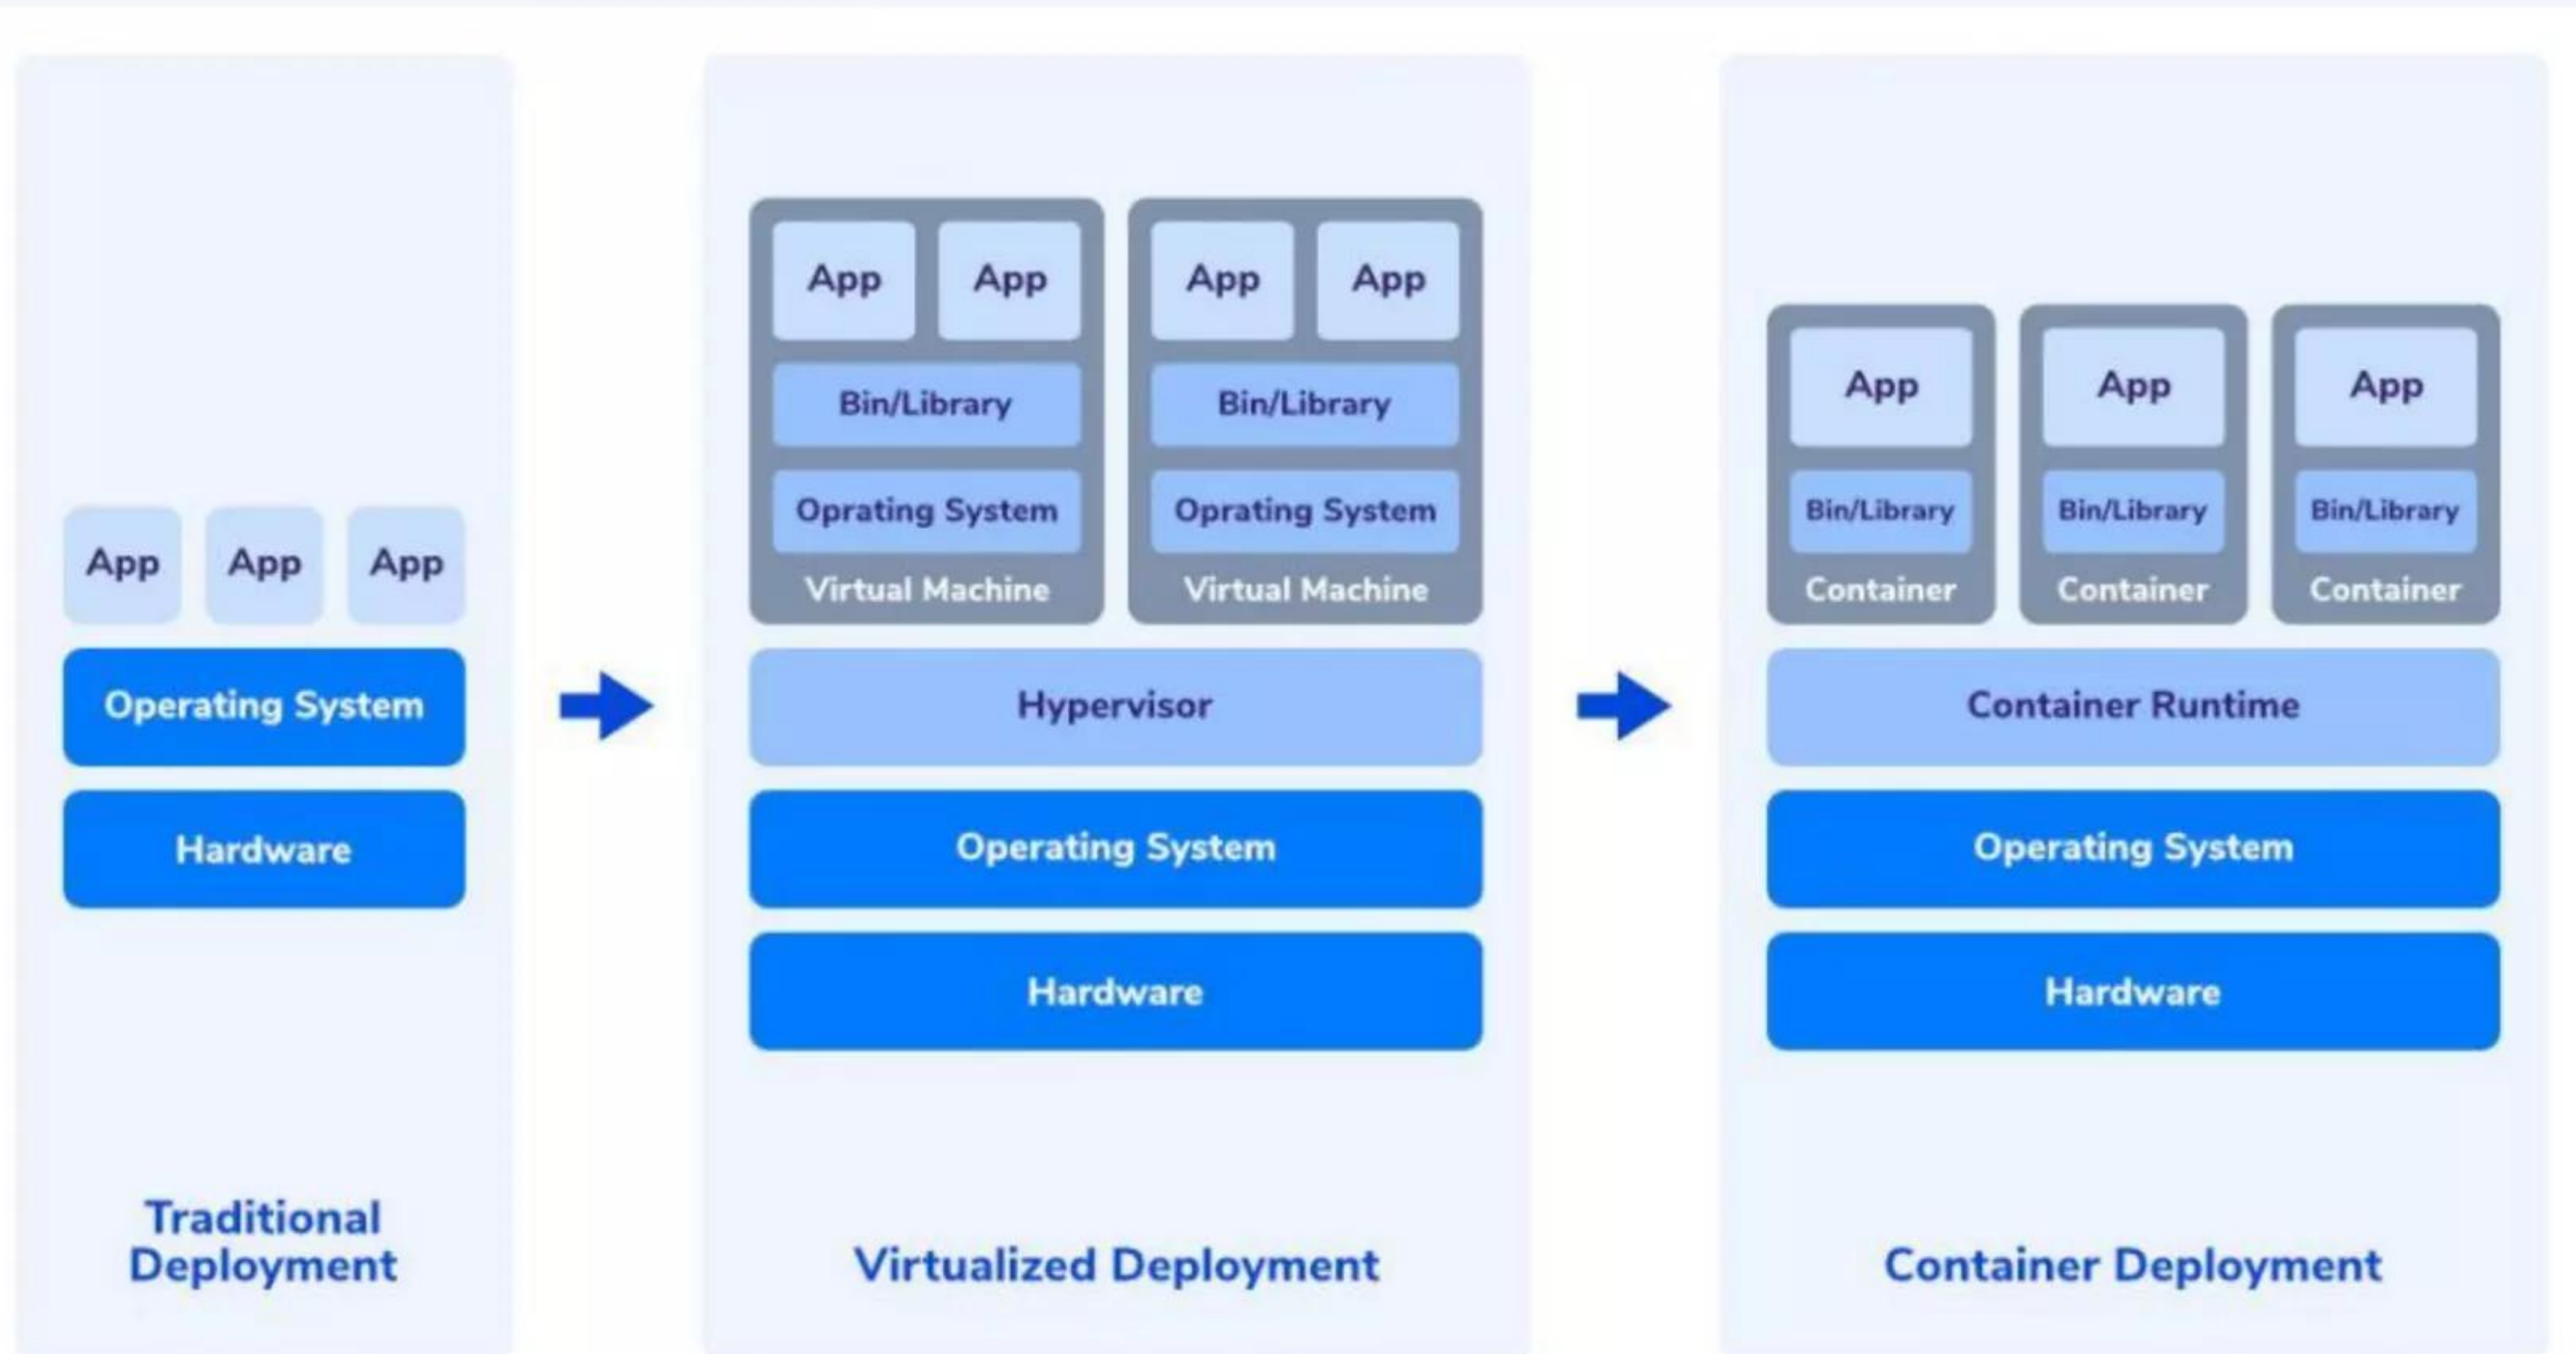

Kubernetes

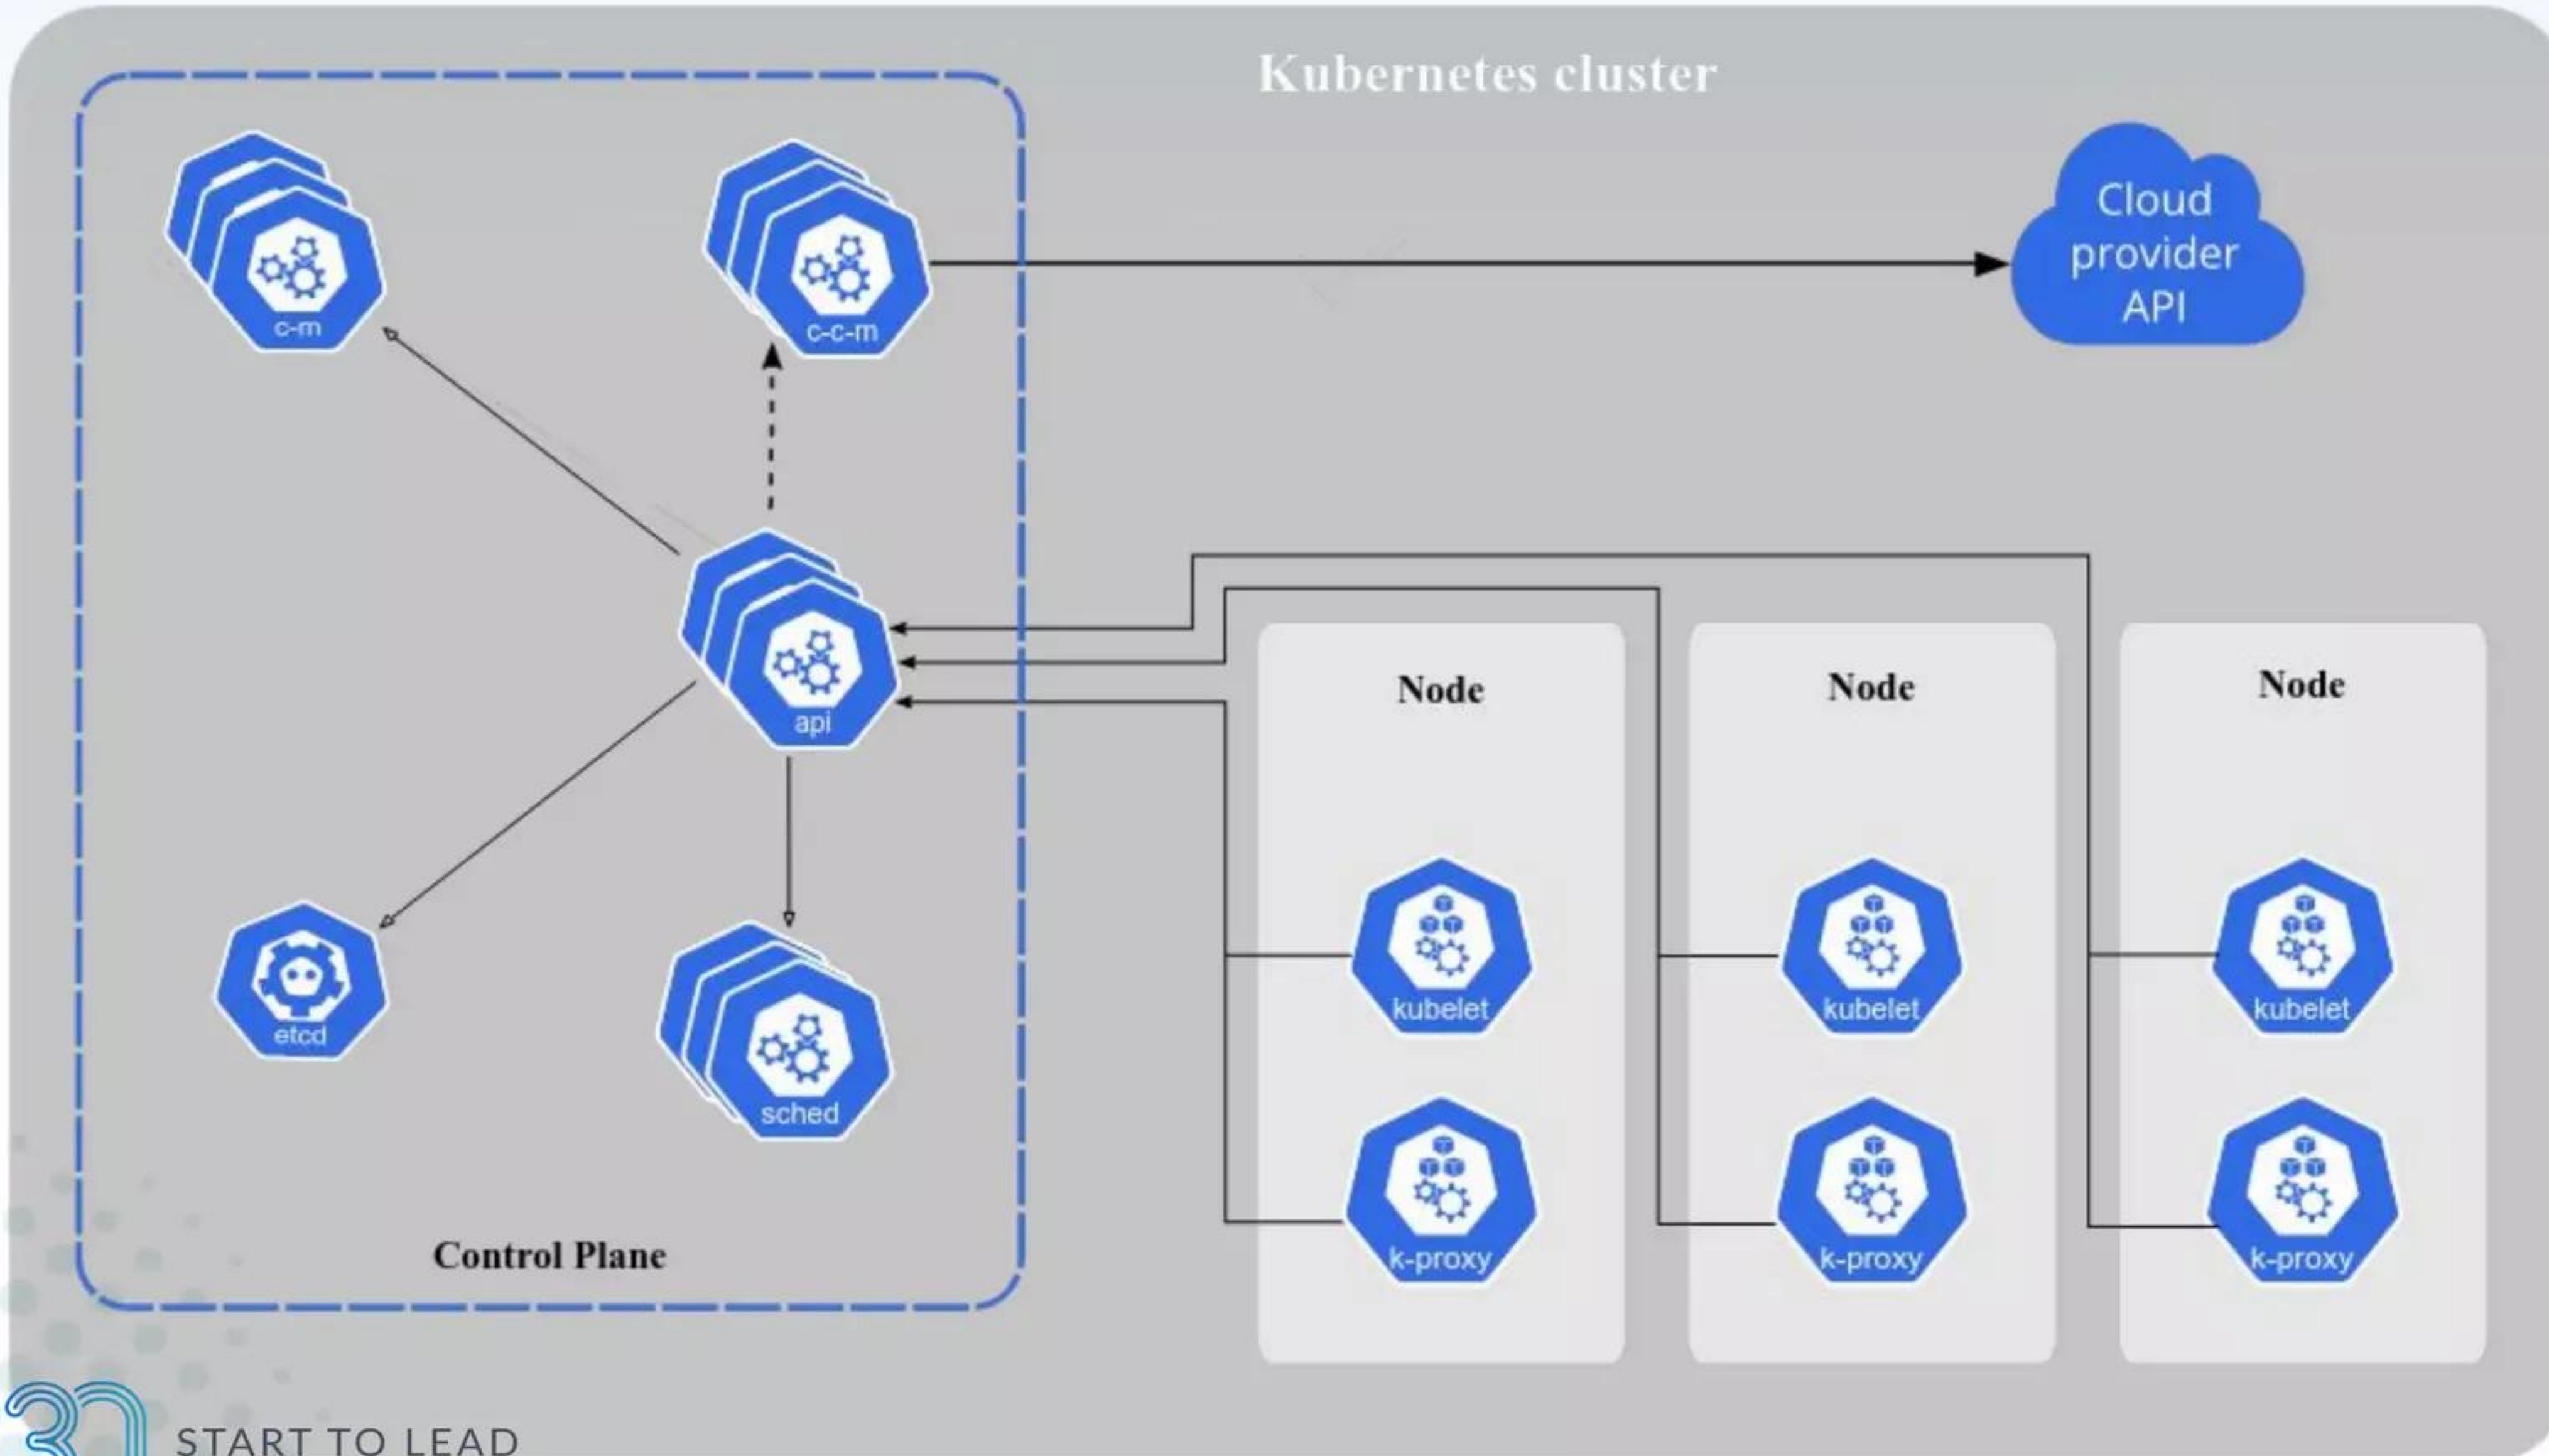

Kubernetes is an open-source container orchestration system for automating software deployment, scaling, and management. Google originally designed Kubernetes, but the Cloud Native Computing Foundation now maintains the project.

also known as K8s. K8s could automate the deployment, scaling, and management of containerized applications.

Kubernetes

Kubernetes

- API server** 
- Cloud controller manager (optional)** 
- Controller manager** 
- etcd (persistence store)** 
- kubelet** 
- kube-proxy** 
- Scheduler** 
- Control plane** 
- Node** 

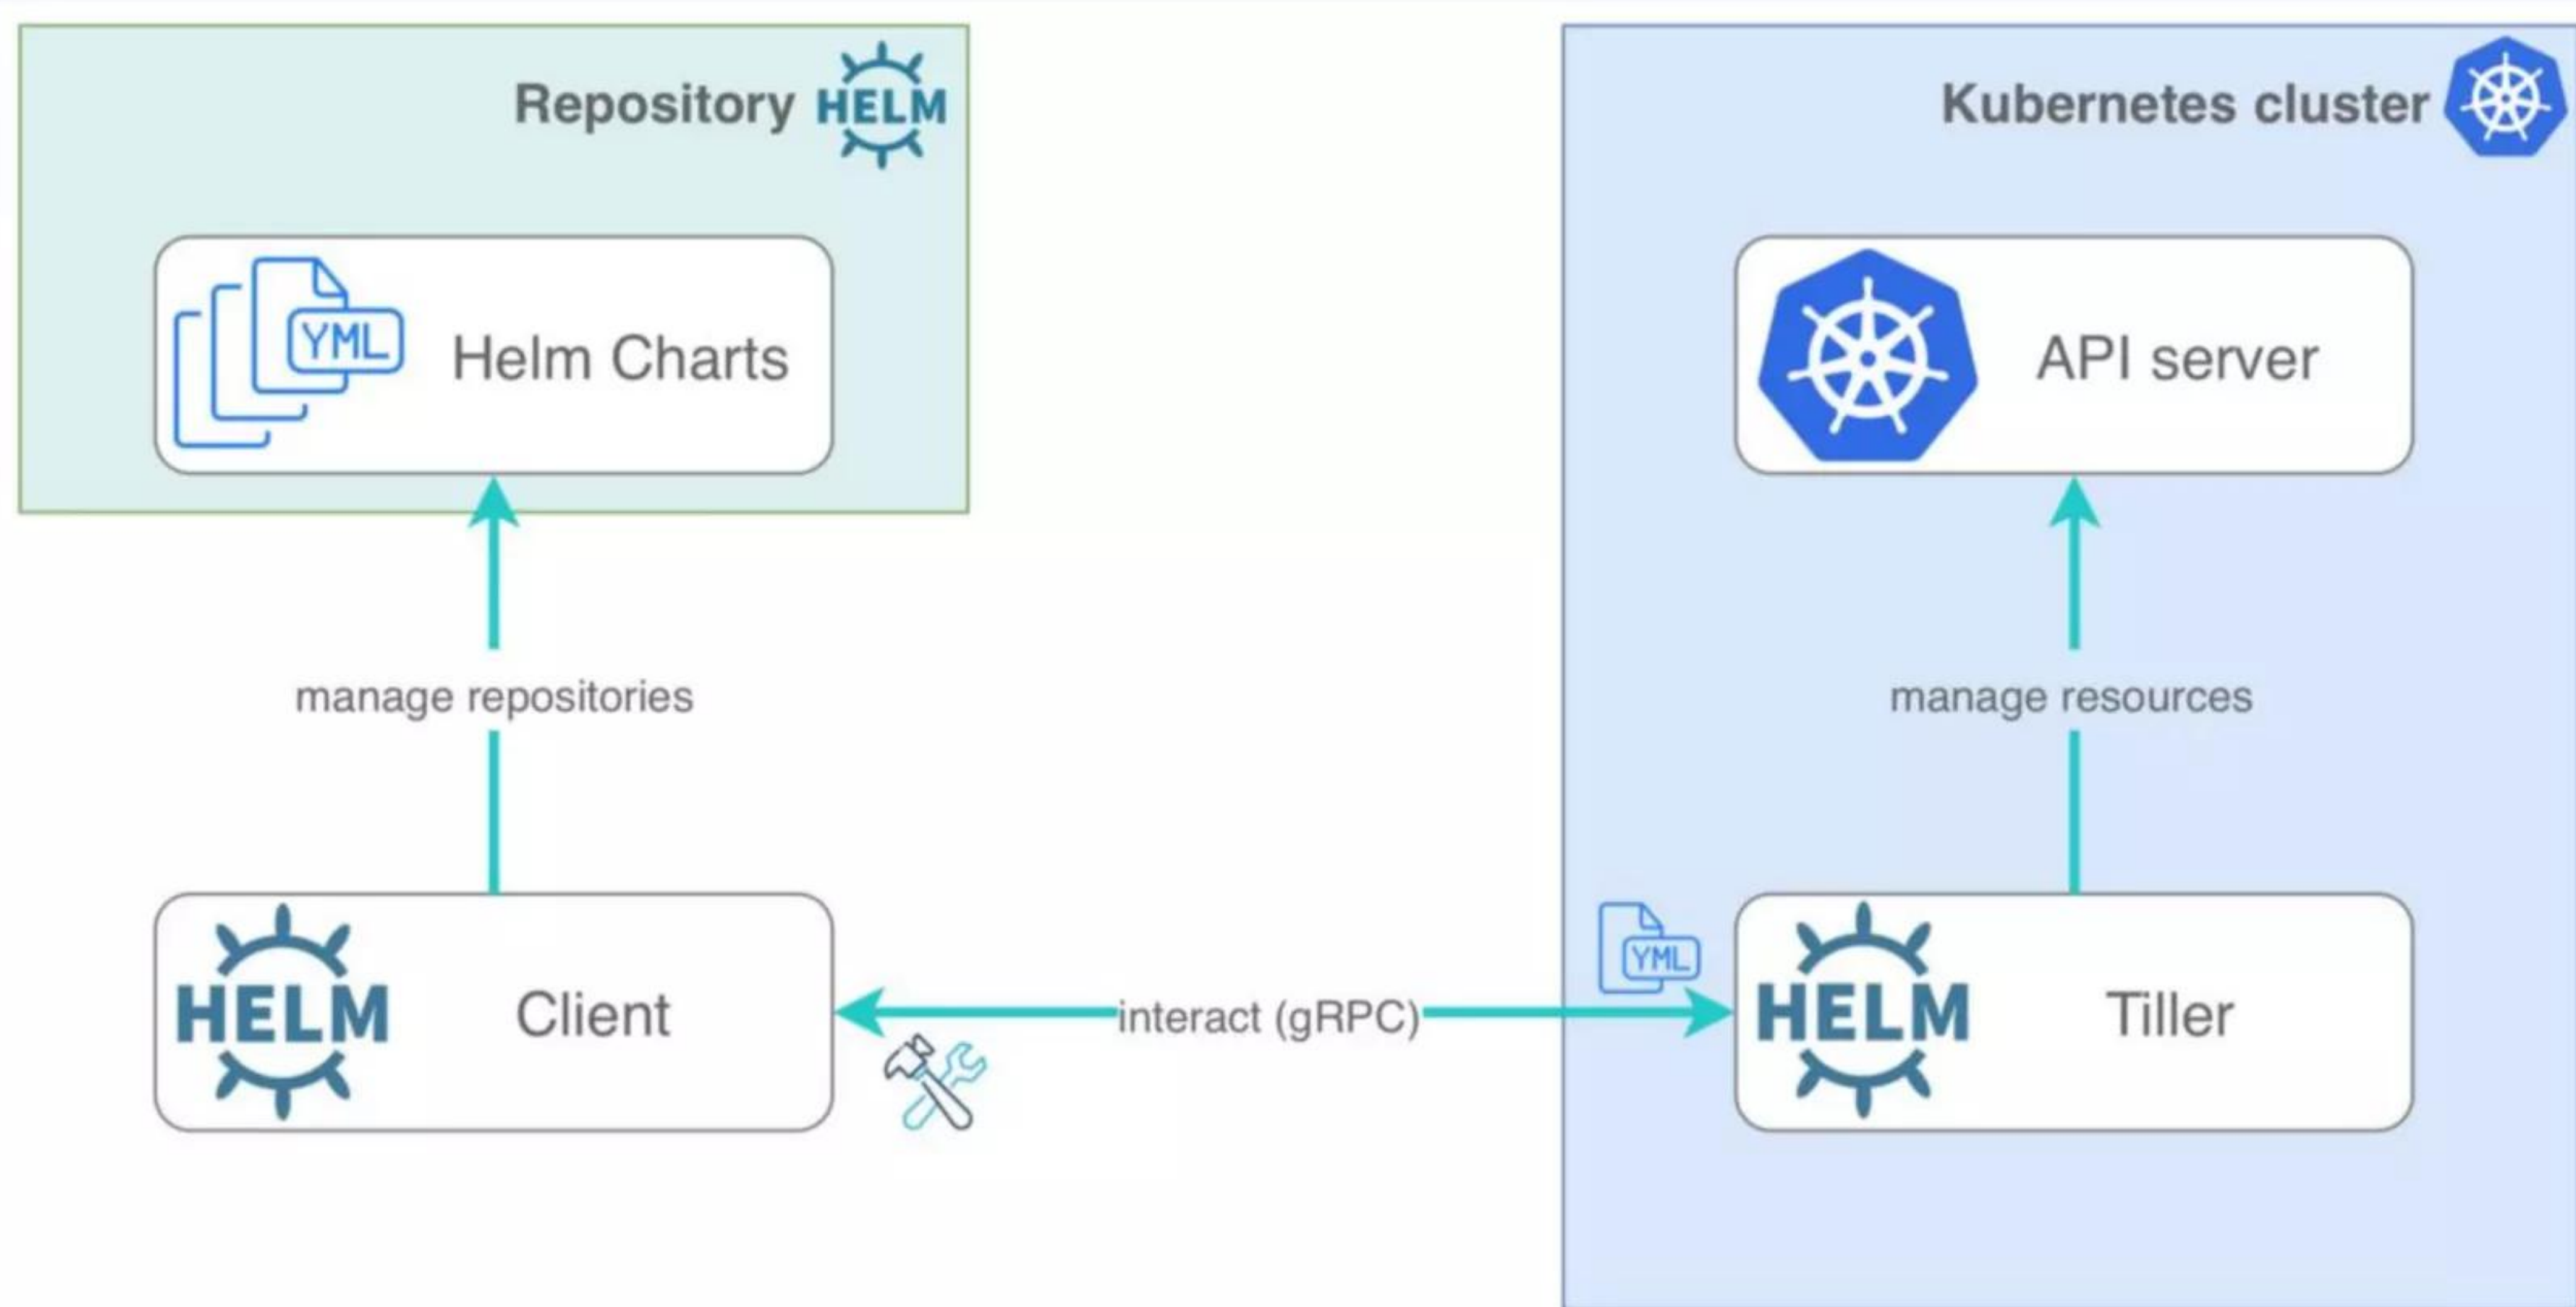

Helm and Helm Chart

The
package manager
for Kubernetes

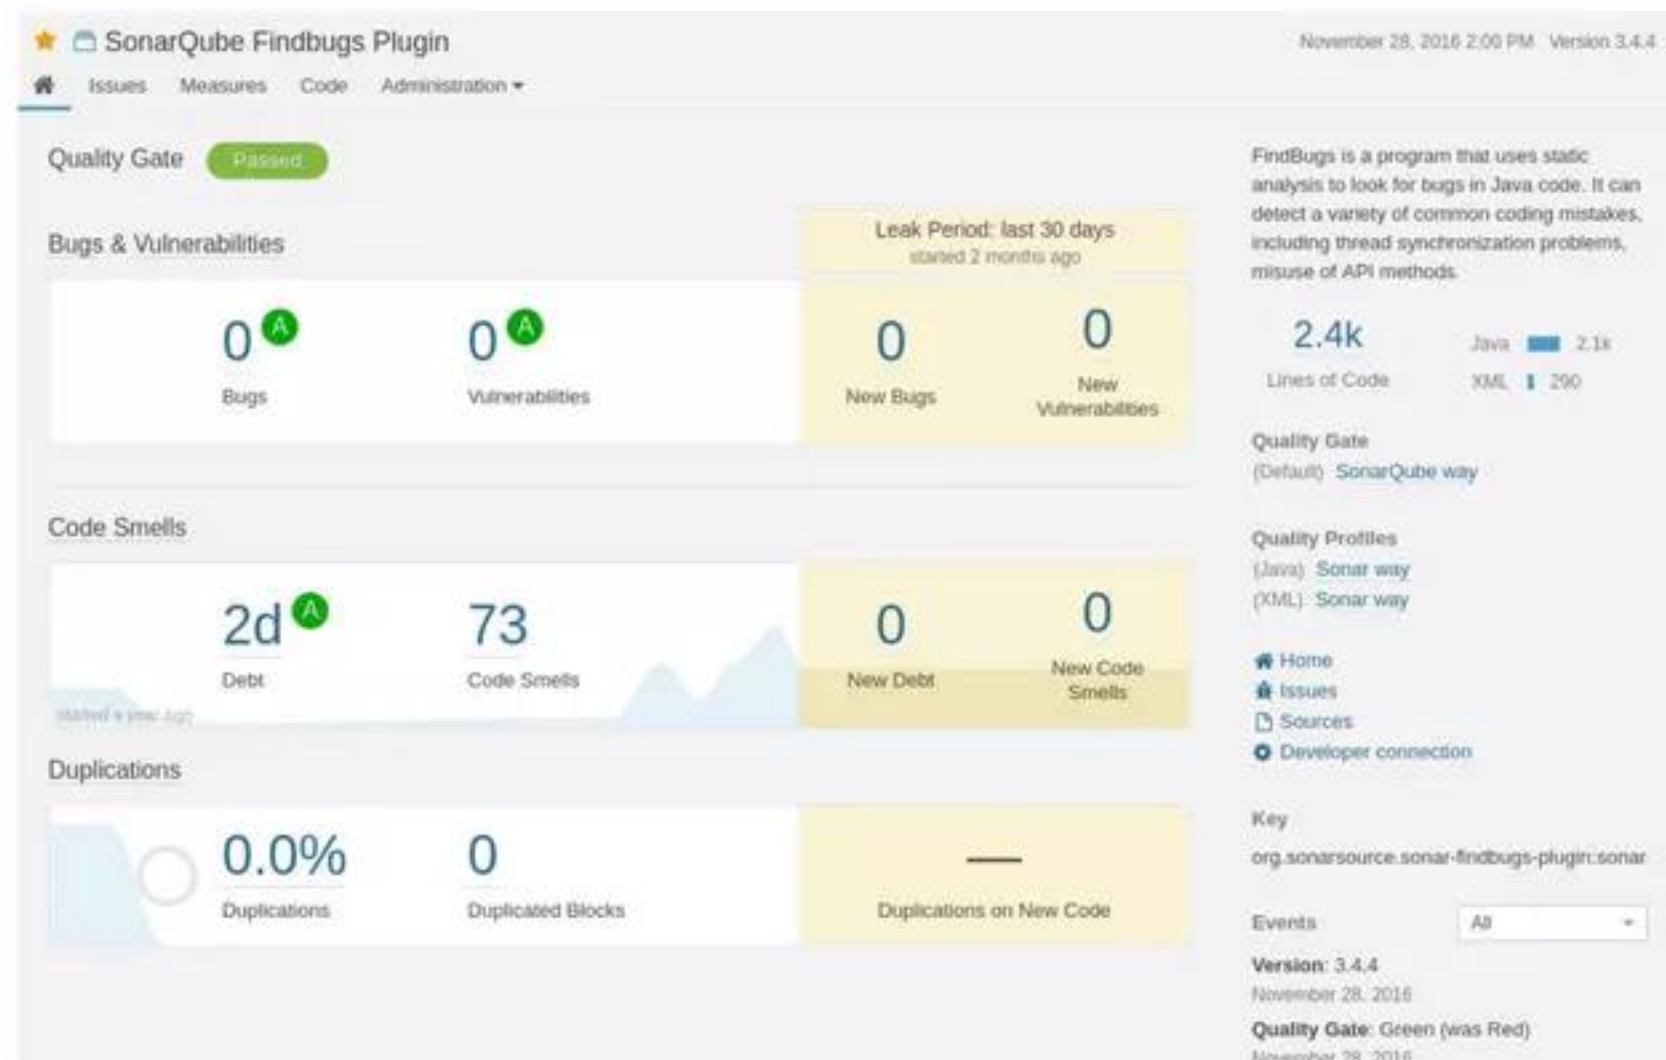

- helps you manage Kubernetes applications – Helm Charts help you define, install, and upgrade even the most complex Kubernetes application.
- Helm Charts are simply **Kubernetes YAML manifests combined into a single package that can be advertised to your Kubernetes clusters**. Once packaged, installing a Helm Chart into your cluster is as easy as running a single helm install, which really simplifies the deployment of containerized applications.

Helm

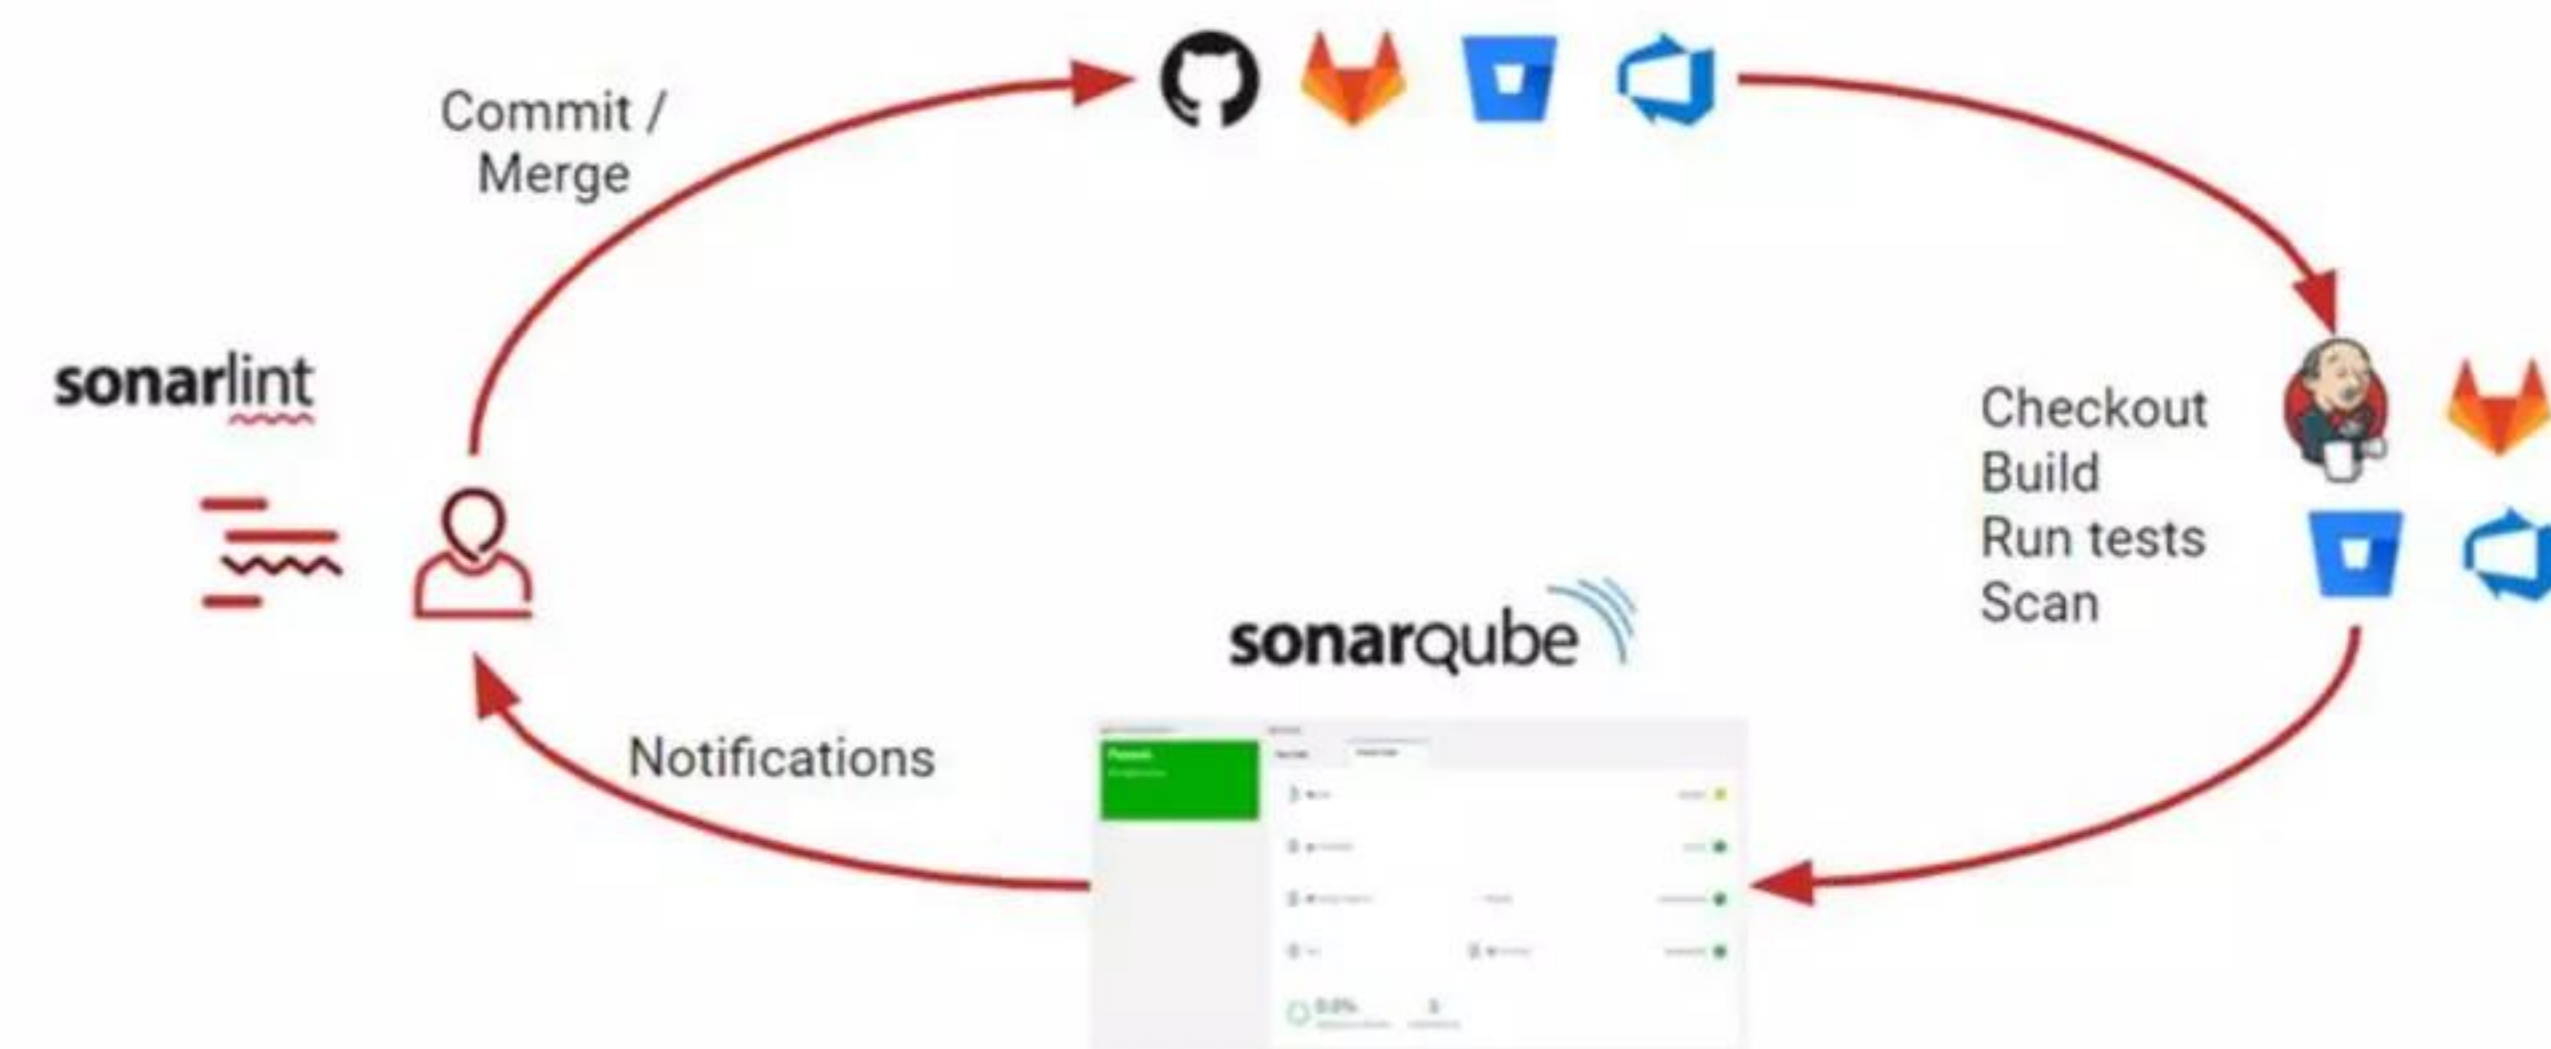

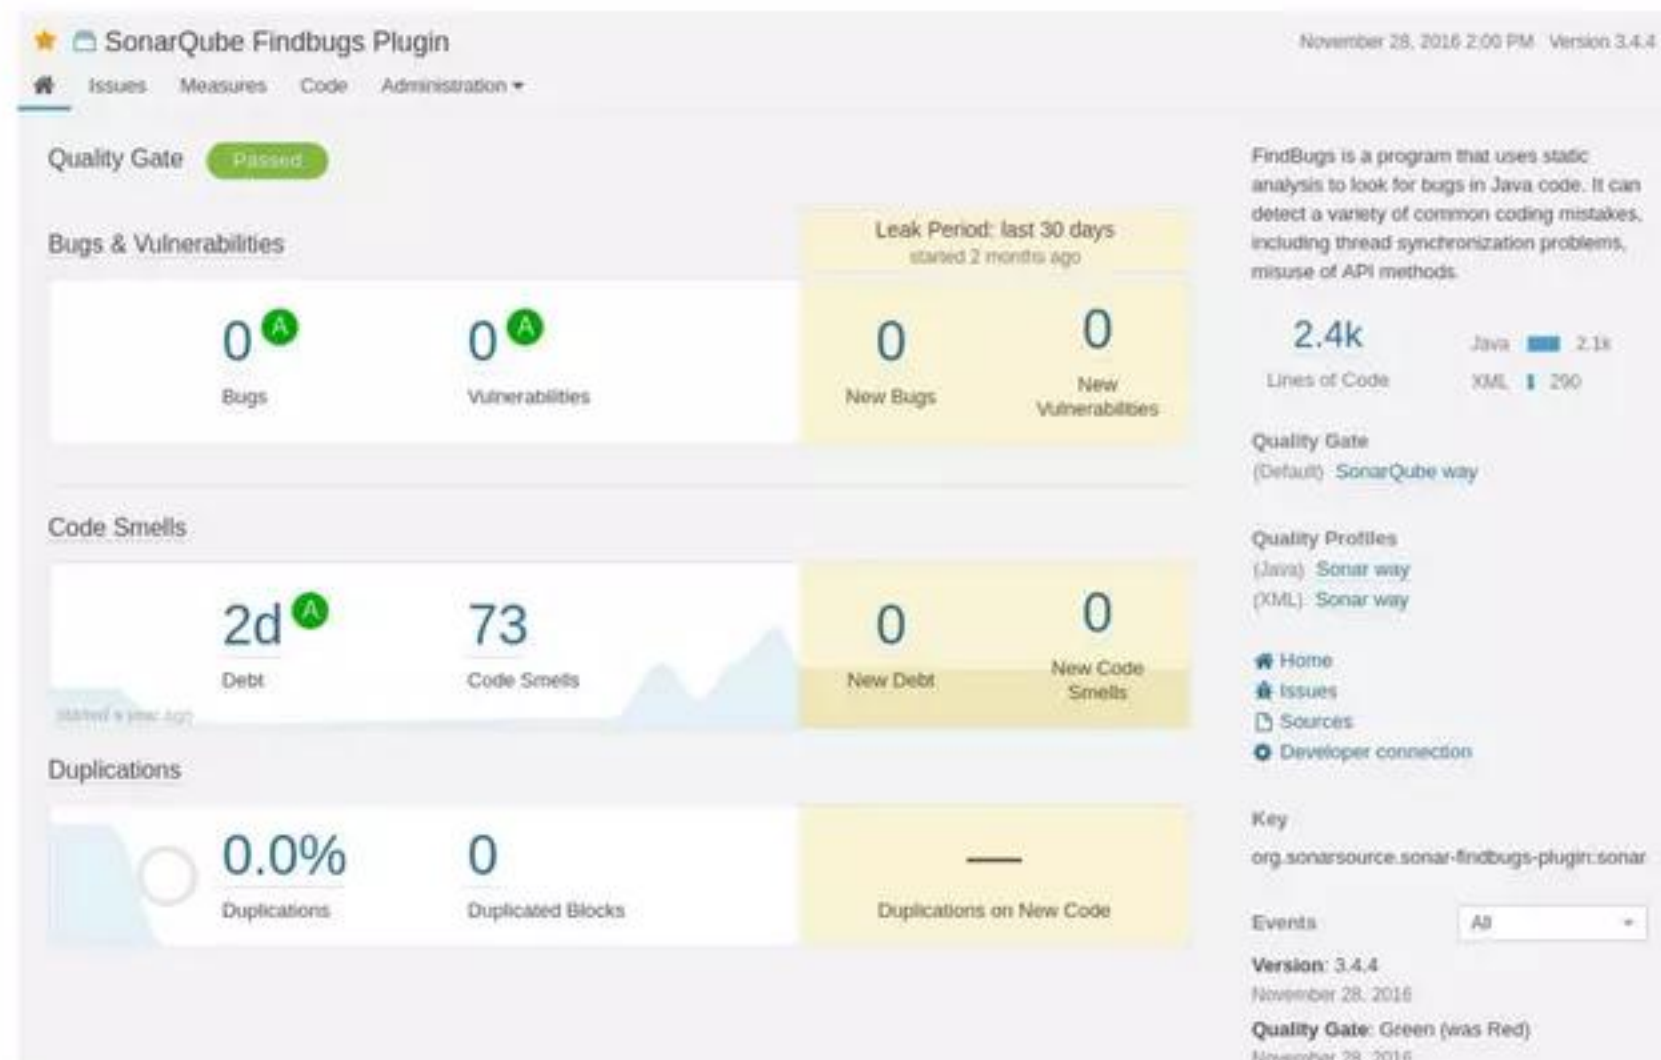

Sonarqube

✓ SonarQube is a **Code Quality Assurance tool that collects and analyzes source code**, and provides reports for the code quality of your project. It combines static and dynamic analysis tools and enables quality to be measured continually over time.

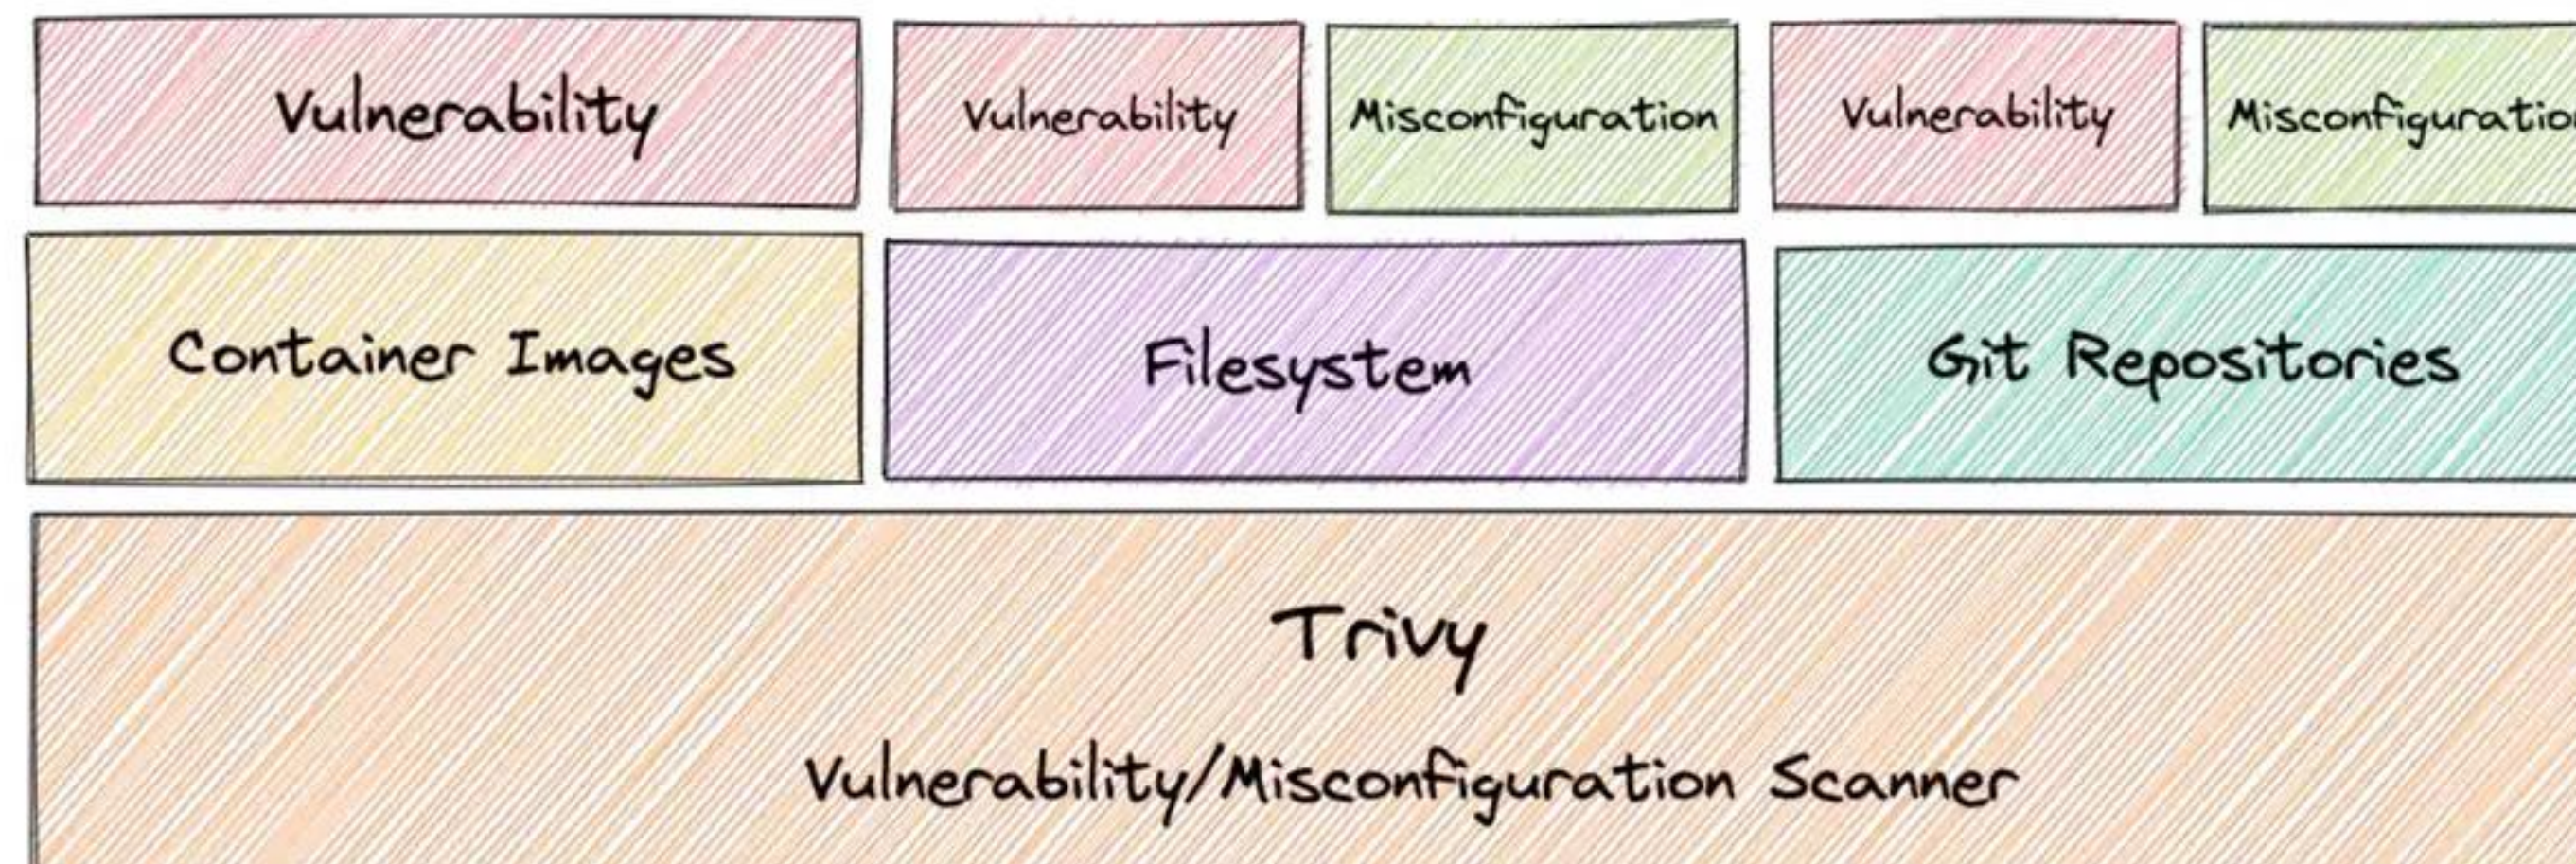

Sonarqube

✓ SonarQube is a **Code Quality Assurance tool that collects and analyzes source code**, and provides reports for the code quality of your project. It combines static and dynamic analysis tools and enables quality to be measured continually over time.

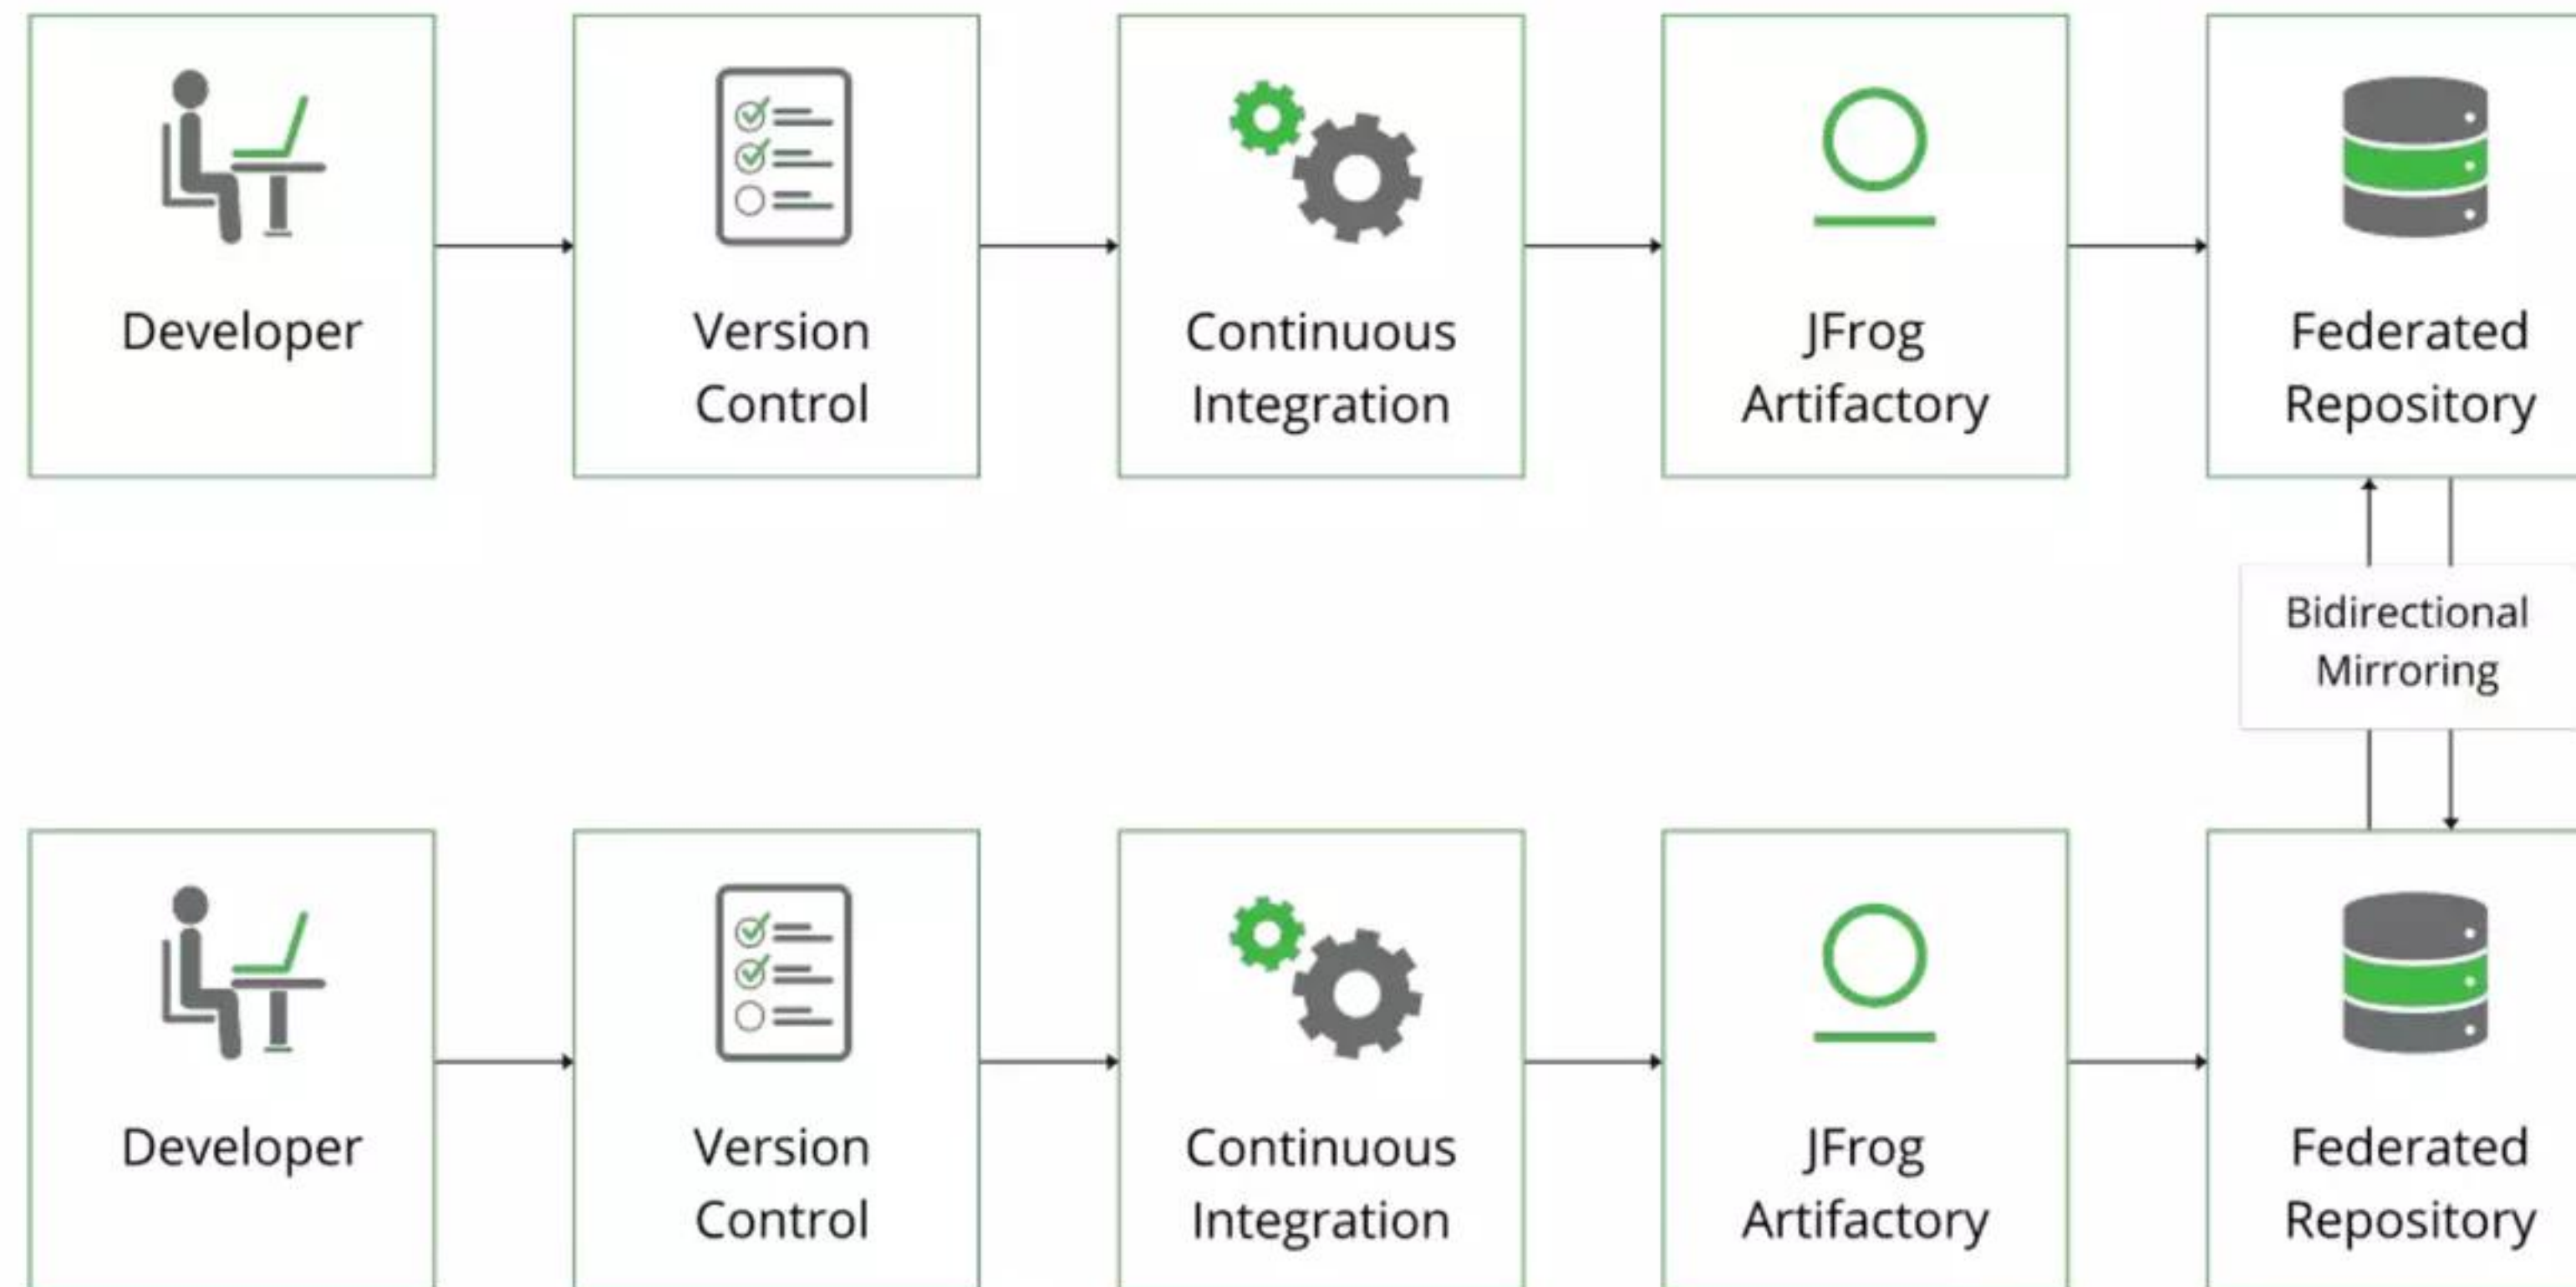

Trivy

- Trivy (tri pronounced like trigger, vy pronounced like envy) is a simple and comprehensive scanner for vulnerabilities in container images, file systems, and Git repositories, as well as for configuration issues.
- Trivy detects vulnerabilities of OS packages (Alpine, RHEL, CentOS, etc.) and language-specific packages (Bundler, Composer, npm, yarn, etc.).
- In addition, Trivy scans Infrastructure as Code (IaC) files such as Terraform, Dockerfile and Kubernetes, to detect potential configuration issues that expose your deployments to the risk of attack.
- <https://aquasecurity.github.io/trivy/v0.21.3/>

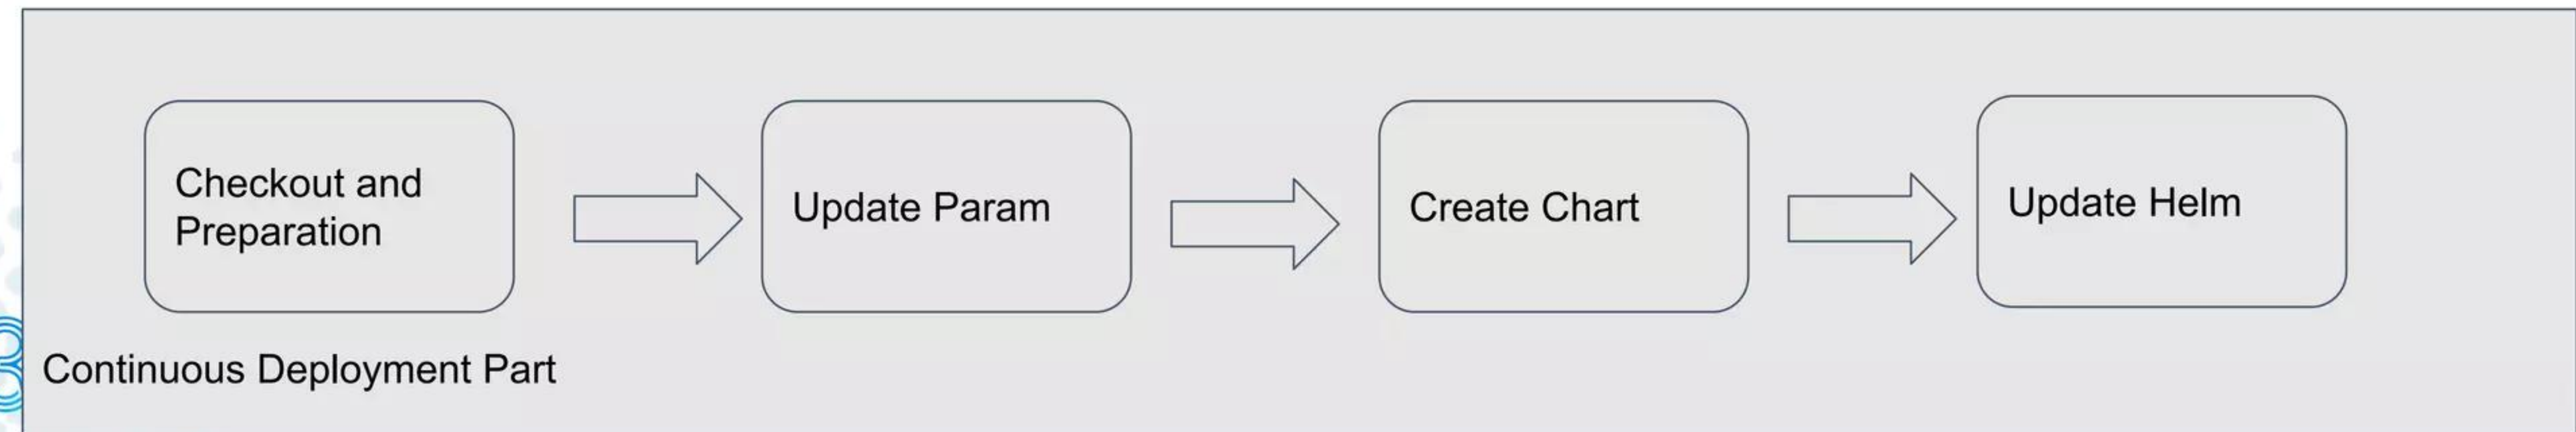

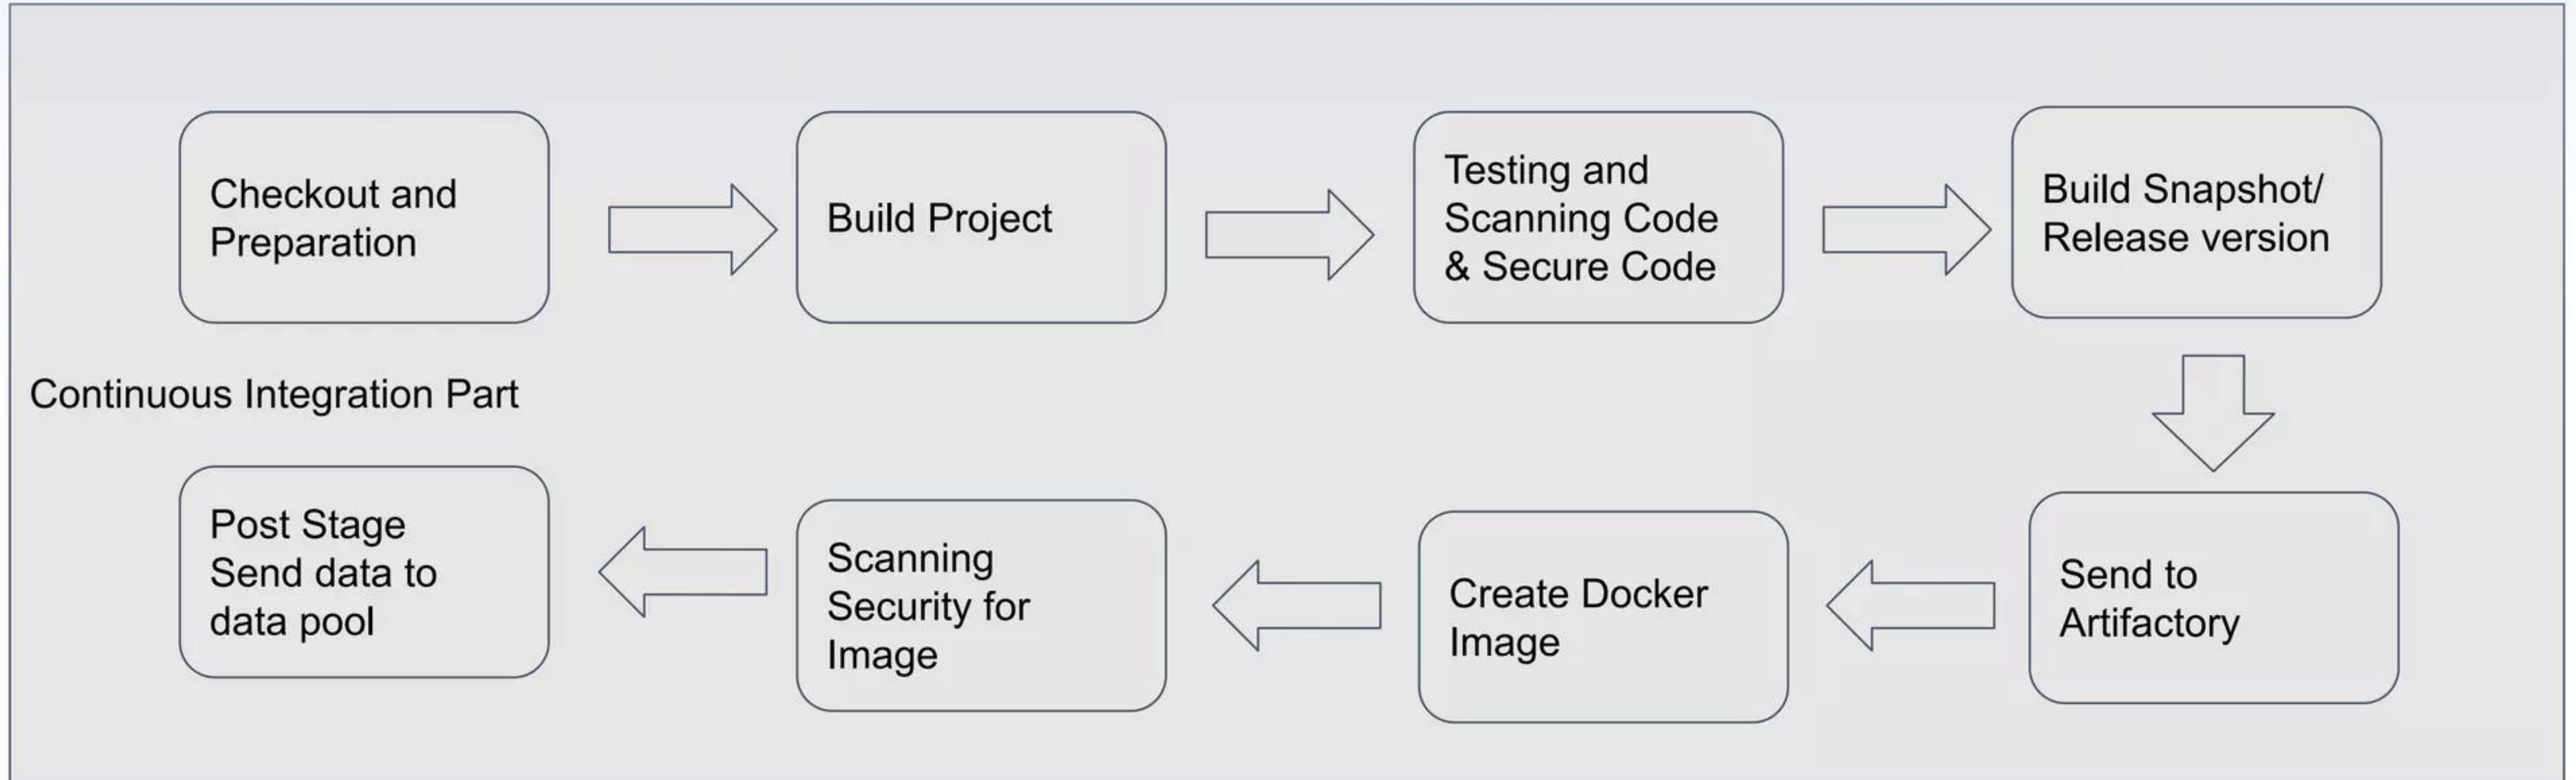

Artifact and Image Repository

- For App Artifact could use Jfrog Artifactory, Nexus, devpi for python, etc
- Docker Image (registry) : GCR, ECR, GCR

Pipeline CI/CD

Create Repository for Images

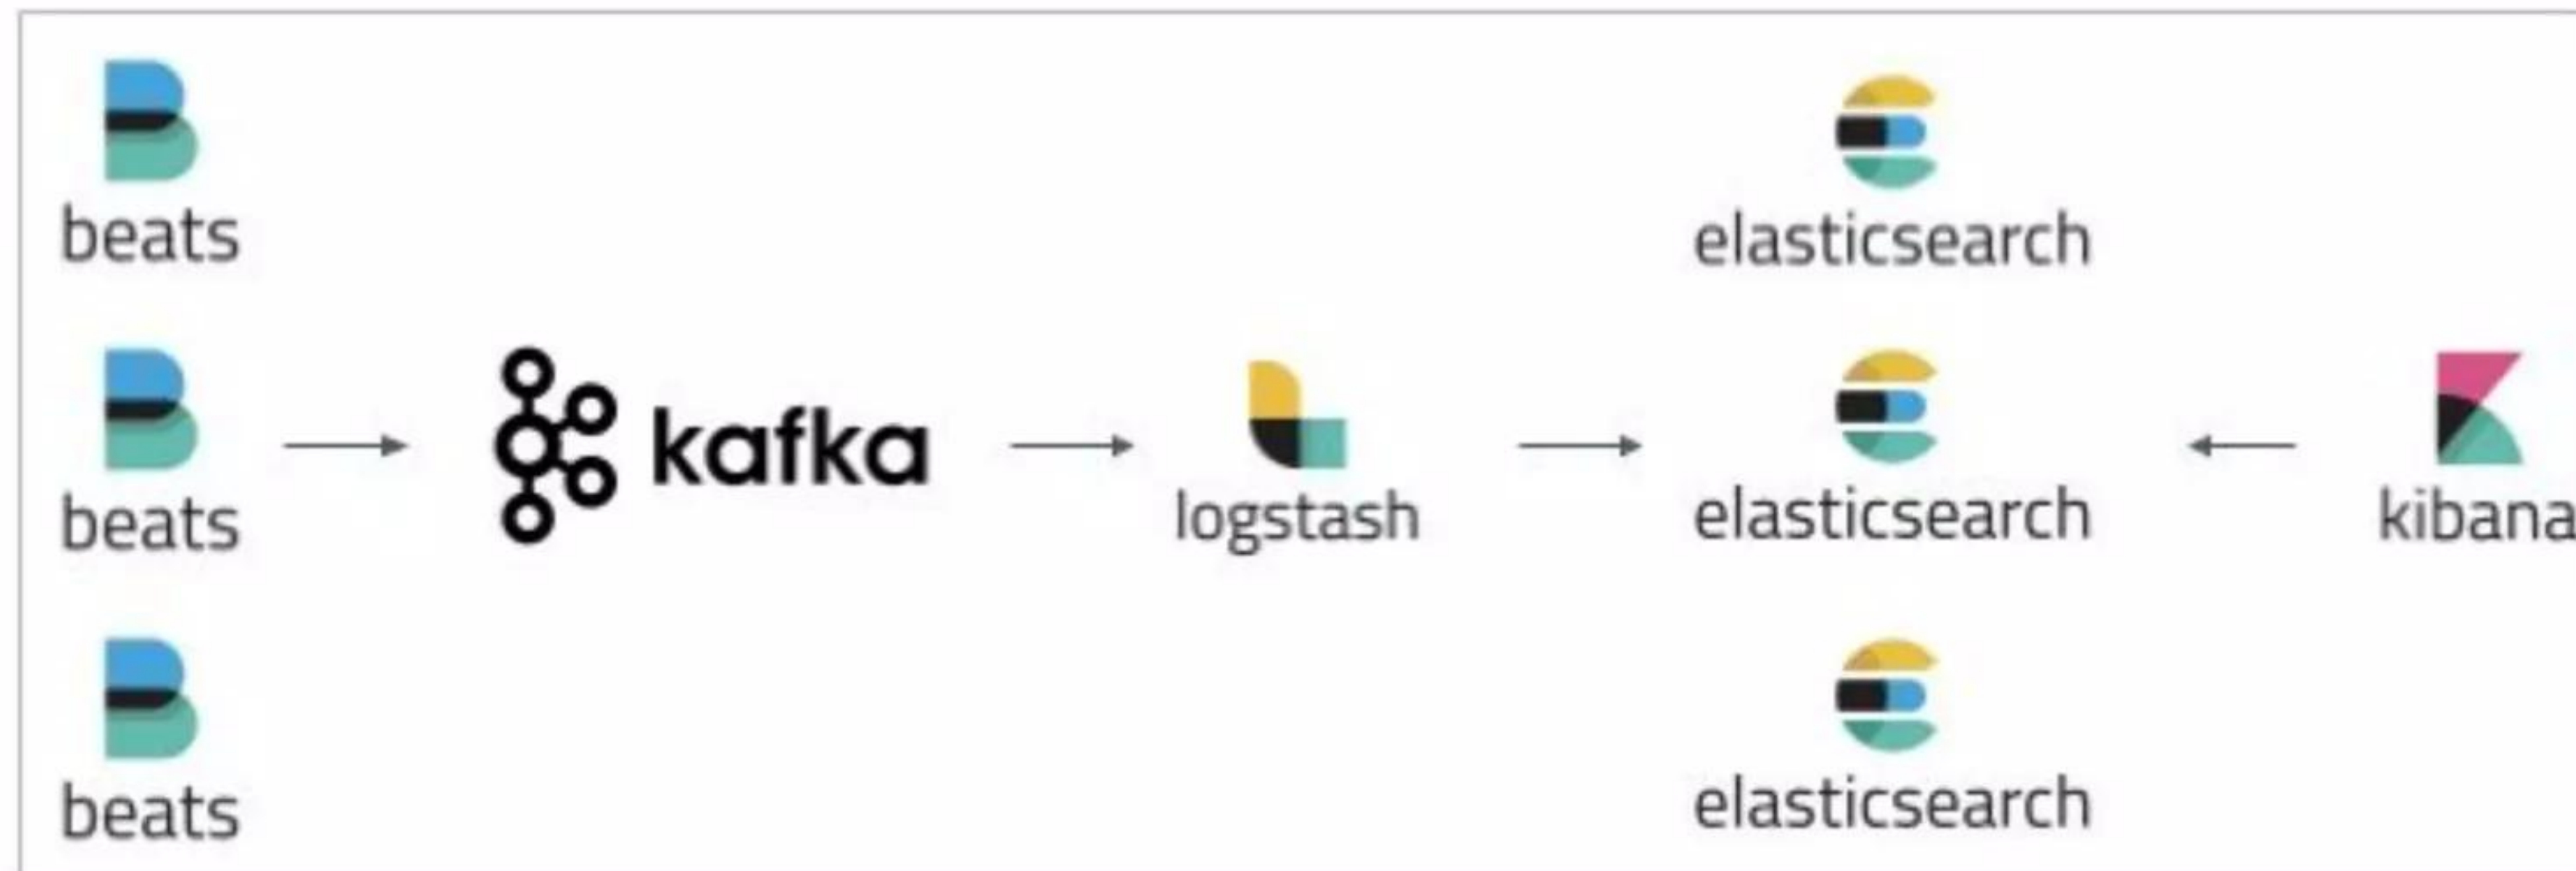

- Base Image for Build
- Base Image for Development
- Default base image
- Jenkins pipeline
- Create standard for the project structure

APM (Application Performance Management)

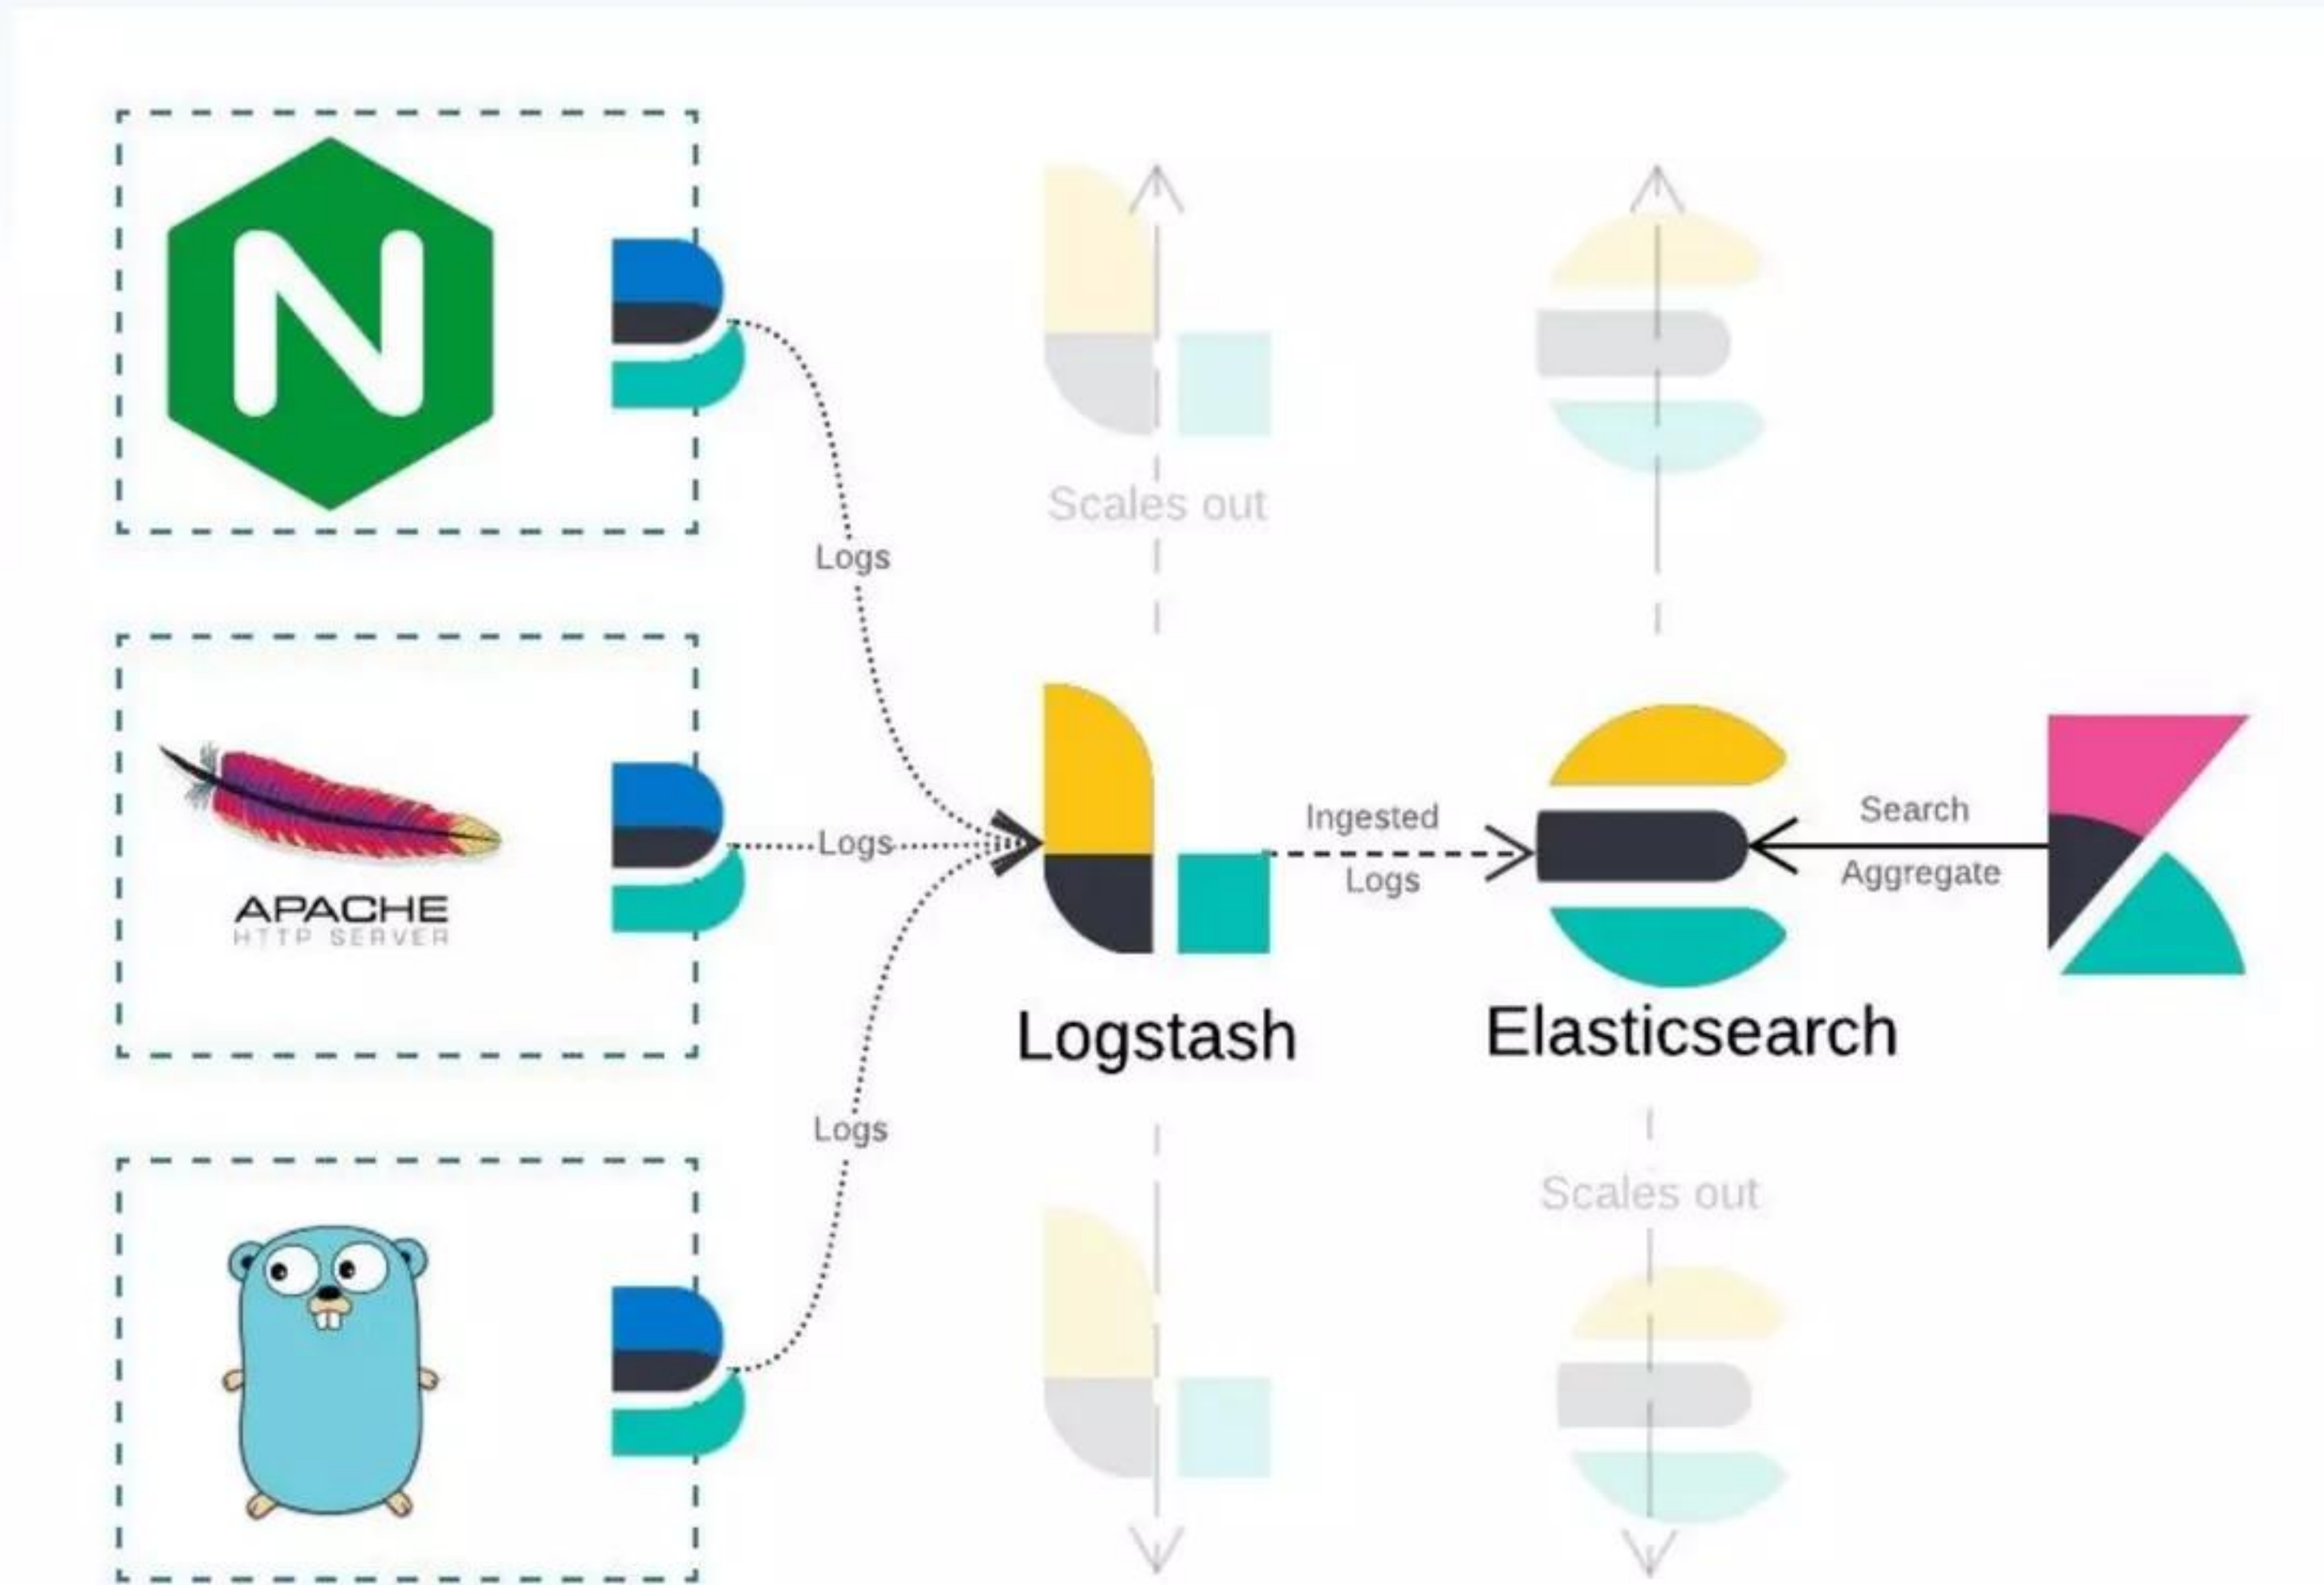

- the monitoring and management of performance and availability of software applications. APM strives to detect and diagnose complex application performance problems to maintain an expected level of service.
- Tools: DataDog, New Relic, Splunk, ELK Stack (Elasticsearch Logstash Kibana), Grafana, Prometheus

Kubernetes Dashboard

The screenshot shows the Kubernetes Dashboard interface. The browser address bar indicates the URL: `localhost:8001/api/v1/namespaces/kube-system/services/https:kubernetes-dashboard:/proxy/#!/log/kube-system/heapster-qhq6r/pod?namespace=kube-system`. The dashboard header includes the Kubernetes logo, a search bar, and a '+ CREATE' button. The left sidebar contains navigation options: Cluster, Namespaces, Nodes, Persistent Volumes, Roles, Storage Classes, Namespace (set to kube-system), Overview, Workloads, Cron Jobs, Daemon Sets, Deployments, Jobs, Pods, Replica Sets, and Replication Controllers. The main content area displays 'Logs from heapster' for the 'heapster-qhq6r' pod. The log output is as follows:

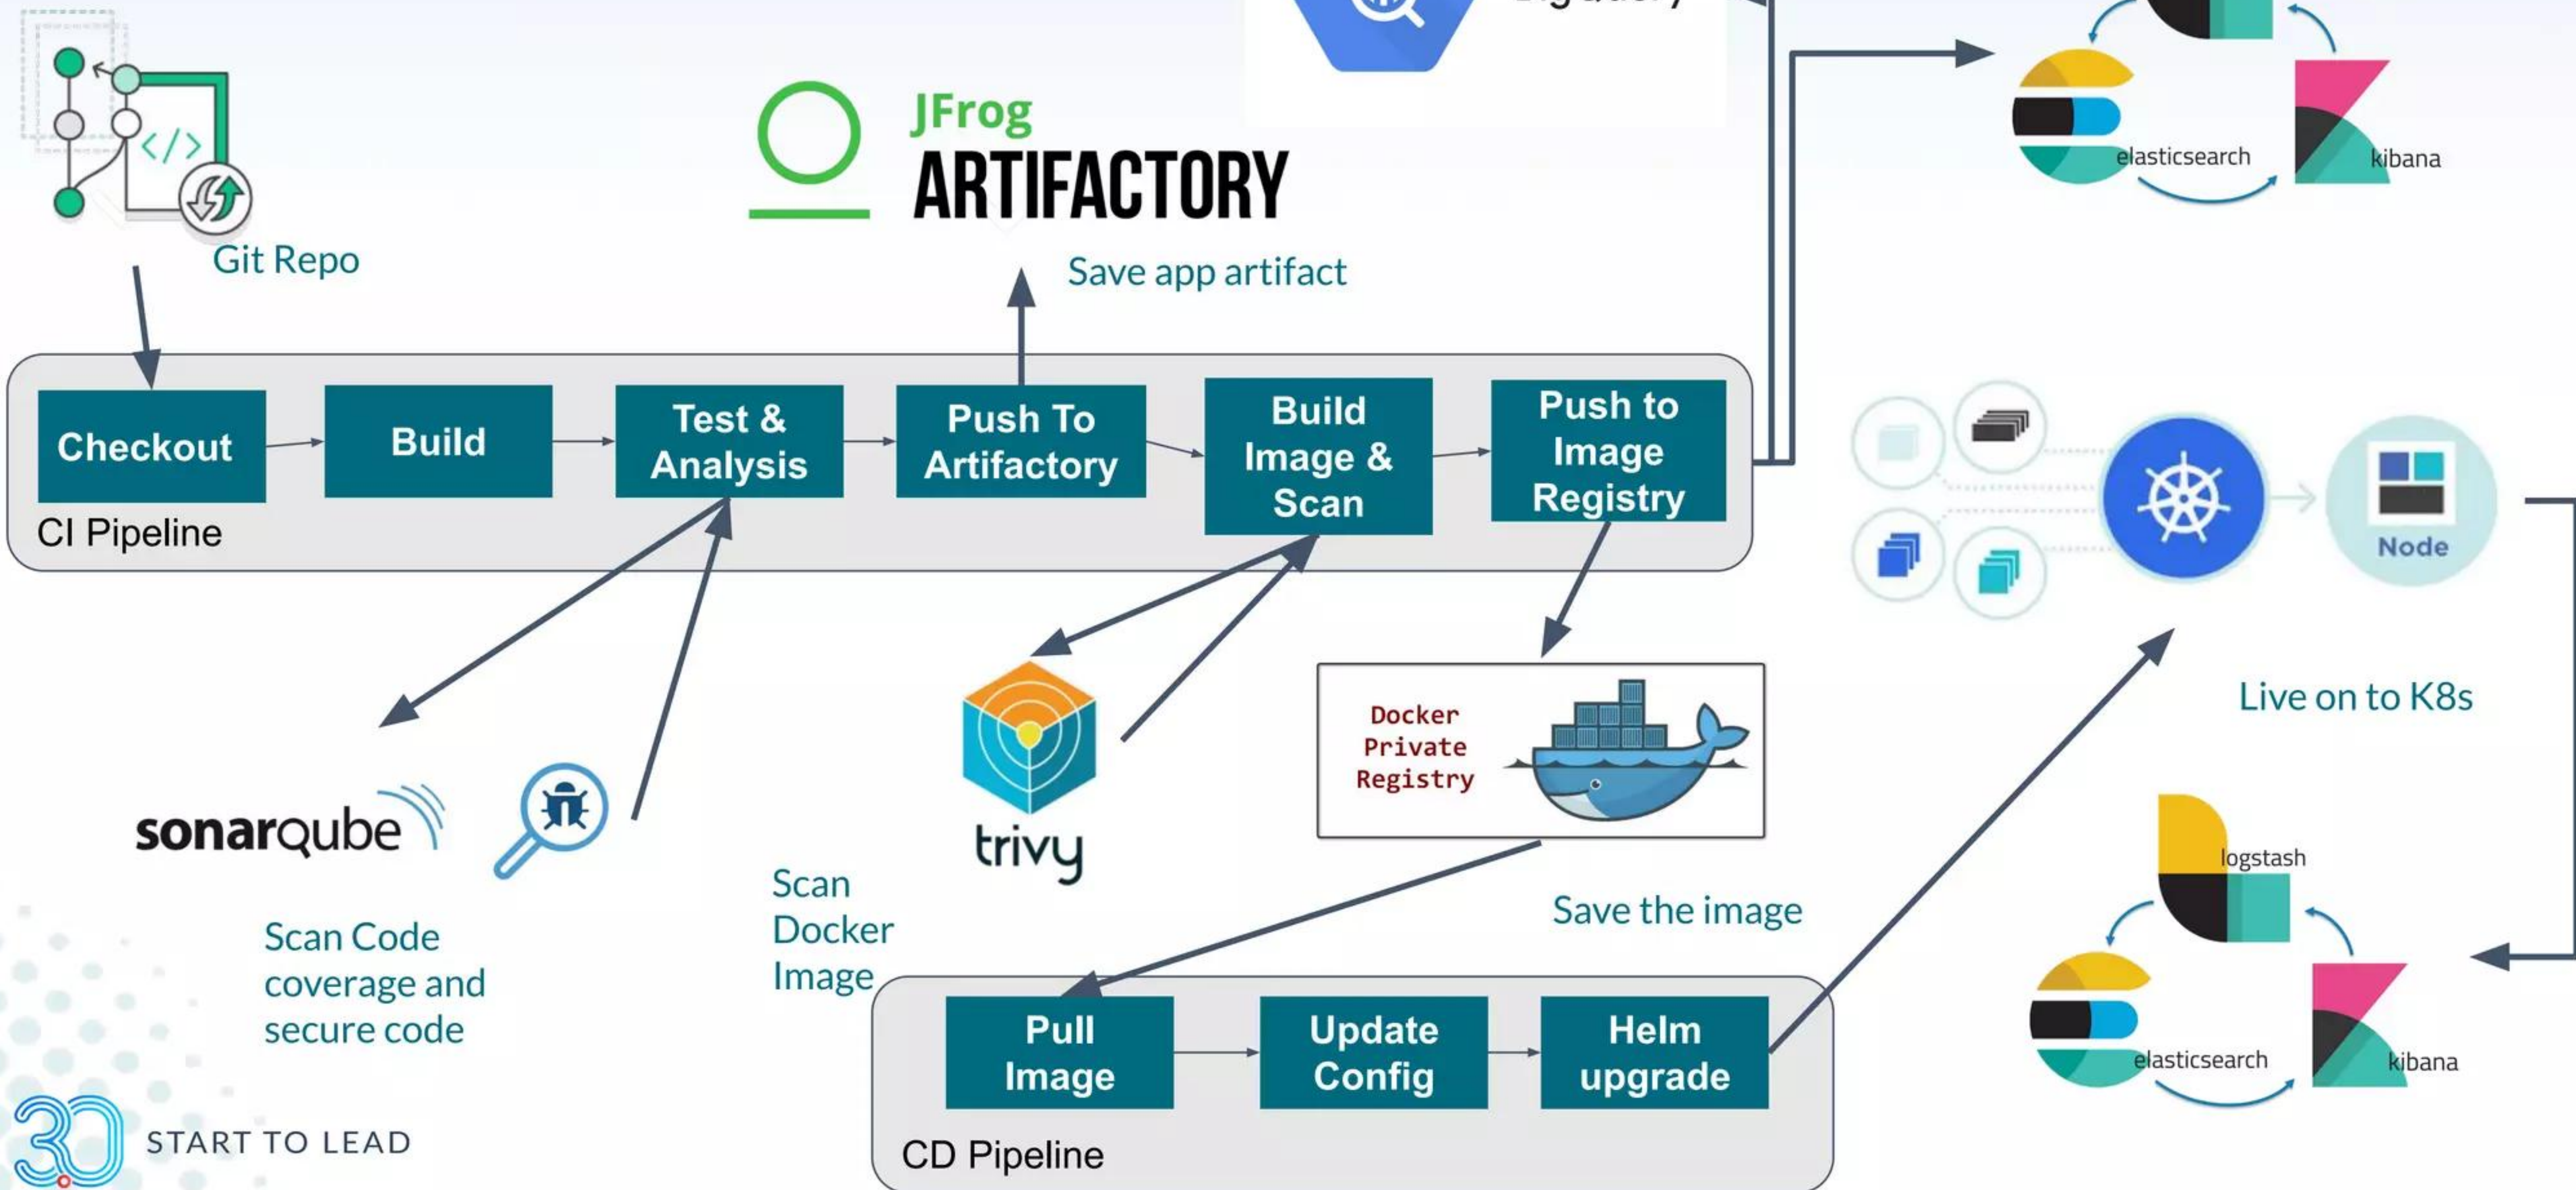

```
I1209 16:55:09.727544 1 heapster.go:78] /heapster --source=kubernetes.summary_api:'' --sink=influxdb:http://monitoring-influxdb:8086 --metric_resolution=60s
I1209 16:55:09.727831 1 heapster.go:79] Heapster version v1.5.3
I1209 16:55:09.728077 1 configs.go:61] Using Kubernetes client with master "https://10.96.0.1:443" and version v1
I1209 16:55:09.728203 1 configs.go:62] Using kubelet port 10255
E1209 16:57:22.090834 1 influxdb.go:297] issues while creating an InfluxDB sink: failed to ping InfluxDB server at "monitoring-influxdb:8086" - Get http://monitoring-influxdb:8086/ping: dial tcp 10.96.149.9:8086: getsockopt: connection timed out, will retry on use
I1209 16:57:22.091606 1 influxdb.go:312] created influxdb sink with options: host:monitoring-influxdb:8086 user:root db:k8s
I1209 16:57:22.091633 1 heapster.go:202] Starting with InfluxDB Sink
I1209 16:57:22.091638 1 heapster.go:202] Starting with Metric Sink
I1209 16:57:22.115175 1 heapster.go:112] Starting heapster on port 8082
I1209 16:58:05.074575 1 influxdb.go:274] Created database "k8s" on influxDB server at "monitoring-influxdb:8086"
W1209 18:34:08.704456 1 heapster.go:301] No current data batch available (latest: 2018-12-09 18:22:00 +0000 UTC).
W1209 18:34:38.714716 1 heapster.go:301] No current data batch available (latest: 2018-12-09 18:23:00 +0000 UTC).
```

At the bottom of the log viewer, it shows 'Logs from 12/9/18 4:55 PM to 12/9/18 6:34 PM UTC' and navigation arrows.

App Tech Stack

- Programming Language: java, kotlin, python, golang, php
- Database: mysql, postgre, sql server, mongodb, redis, etc
- Search engine: elasticsearch, solr
- Messaging app: RabbitMQ, Kafka
